

**California Department of Education  
Assessment Development and  
Administration Division**

**California Modified Assessment  
Technical Report  
Spring 2013 Administration**

**Submitted March 31, 2014  
Educational Testing Service  
Contract No. 5417**

# Table of Contents

Acronyms and Initialisms Used in the <i>CMA Technical Report</i> .....	x
<b>Chapter 1: Introduction</b> .....	<b>1</b>
<b>Background</b> .....	<b>1</b>
<b>Test Purpose</b> .....	<b>1</b>
<b>Test Content</b> .....	<b>1</b>
<b>Intended Population</b> .....	<b>2</b>
<b>Intended Use and Purpose of Test Scores</b> .....	<b>2</b>
<b>Testing Window</b> .....	<b>3</b>
<b>Significant STAR Developments in 2013</b> .....	<b>3</b>
Forms Reuse .....	3
Pre-equating and the Implementation of Quick-turnaround Reporting .....	3
Changes to the ELA Reporting Clusters and Score Calculation in Grades Four and Seven .....	3
Number of Available Test Versions .....	4
<b>Limitations of the Assessment</b> .....	<b>4</b>
Score Interpretation .....	4
Out-of-Level Testing .....	4
Score Comparison .....	4
<b>Groups and Organizations Involved with the STAR Program</b> .....	<b>4</b>
State Board of Education .....	4
California Department of Education .....	5
Contractors .....	5
<b>Overview of the Technical Report</b> .....	<b>5</b>
<b>References</b> .....	<b>7</b>
<b>Chapter 2: An Overview of CMA Processes</b> .....	<b>8</b>
<b>Item Development</b> .....	<b>8</b>
Item Formats.....	8
Item Specifications.....	8
Item Banking.....	8
Item Refresh Rate.....	9
<b>Test Assembly</b> .....	<b>9</b>
Test Length .....	9
Test Blueprints.....	9
Content Rules and Item Selection.....	9
Psychometric Criteria .....	10
<b>Test Administration</b> .....	<b>10</b>
Test Security and Confidentiality.....	10
Procedures to Maintain Standardization .....	11
<b>Test Variations and Accommodations</b> .....	<b>11</b>
Special Services Summaries .....	12
<b>Scores</b> .....	<b>13</b>
Aggregation Procedures .....	13
Post-Equating .....	14
Pre-Equating.....	14
Pre-Equating the Braille Versions of the CMA .....	18
<b>References</b> .....	<b>19</b>
<b>Appendix 2.A—CMA Items and Estimated Time Chart</b> .....	<b>20</b>
<b>Appendix 2.B—Reporting Clusters</b> .....	<b>21</b>
English—Language Arts.....	21
Mathematics.....	22
Science .....	23
<b>Appendix 2.C—2013 CMA Test Variations and Accommodations</b> .....	<b>24</b>
<b>Appendix 2.D—Special Service Summary Tables</b> .....	<b>27</b>
<b>Chapter 3: Item Development</b> .....	<b>60</b>
<b>Rules for Item Development</b> .....	<b>60</b>
Item Specifications.....	60
Expected Item Ratio.....	61
<b>Selection of Item Writers</b> .....	<b>62</b>
Criteria for Selecting Item Writers .....	62
<b>Item Review Process</b> .....	<b>62</b>
Contractor Review .....	63

Content Expert Reviews .....	64
Statewide Pupil Assessment Review Panel .....	67
<b>Field Testing .....</b>	<b>67</b>
Stand-alone Field Testing .....	67
Embedded Field-test Items .....	68
<b>CDE Data Review .....</b>	<b>69</b>
<b>Item Banking .....</b>	<b>69</b>
<b>References .....</b>	<b>71</b>
<b>Chapter 4: Test Assembly .....</b>	<b>72</b>
<b>Test Length .....</b>	<b>72</b>
<b>Rules for Item Selection .....</b>	<b>72</b>
Test Blueprint .....	72
Content Rules and Item Selection .....	73
Psychometric Criteria .....	73
Projected Psychometric Properties of the Assembled Tests .....	75
<b>Rules for Item Sequence and Layout .....</b>	<b>76</b>
<b>Reference .....</b>	<b>77</b>
<b>Appendix 4.A—Technical Characteristics .....</b>	<b>78</b>
<b>Appendix 4.B—Cluster Targets .....</b>	<b>83</b>
<b>Chapter 5: Test Administration .....</b>	<b>99</b>
<b>Test Security and Confidentiality .....</b>	<b>99</b>
ETS’s Office of Testing Integrity .....	99
Test Development .....	99
Item and Data Review .....	99
Item Banking .....	100
Transfer of Forms and Items to the CDE .....	100
Security of Electronic Files Using a Firewall .....	100
Printing and Publishing .....	101
Test Administration .....	101
Test Delivery .....	101
Processing and Scoring .....	102
Data Management .....	102
Transfer of Scores via Secure Data Exchange .....	103
Statistical Analysis .....	103
Reporting and Posting Results .....	103
Student Confidentiality .....	103
Student Test Results .....	103
<b>Procedures to Maintain Standardization .....</b>	<b>104</b>
Test Administrators .....	104
Directions for Administration .....	105
District and Test Site Coordinator Manual .....	105
STAR Management System Manuals .....	106
Test Booklets .....	106
<b>Test Variations and Accommodations .....</b>	<b>106</b>
Identification .....	107
Scoring .....	107
<b>Demographic Data Corrections .....</b>	<b>107</b>
<b>Testing Irregularities .....</b>	<b>107</b>
Social Media Security Breaches .....	108
<b>Test Administration Incidents .....</b>	<b>108</b>
<b>References .....</b>	<b>109</b>
<b>Chapter 6: Performance Standards .....</b>	<b>110</b>
<b>Background .....</b>	<b>110</b>
<b>Standard-Setting Procedure .....</b>	<b>110</b>
Development of Competencies Lists .....	112
<b>Standard-Setting Methodology .....</b>	<b>112</b>
Bookmark Method .....	112
<b>Results .....</b>	<b>113</b>
<b>References .....</b>	<b>114</b>
<b>Chapter 7: Scoring and Reporting .....</b>	<b>115</b>
<b>Procedures for Maintaining and Retrieving Individual Scores .....</b>	<b>115</b>
Scoring and Reporting Specifications .....	115
Scanning and Scoring .....	116

<b>Types of Scores and Subscores</b> .....	<b>116</b>
Raw Score .....	116
Subscore .....	116
Scale Score .....	116
Performance Levels .....	116
Writing Response Score .....	117
<b>Score Verification Procedures</b> .....	<b>117</b>
Scoring Key Verification Process .....	117
Monitoring and Quality Control of Writing Scoring .....	118
Score Verification Process .....	120
<b>Overview of Score Aggregation Procedures</b> .....	<b>120</b>
Individual Scores .....	120
<b>Reports Produced and Scores for Each Report</b> .....	<b>124</b>
Types of Score Reports .....	124
Score Report Contents .....	124
Score Report Applications .....	125
<b>Criteria for Interpreting Test Scores</b> .....	<b>126</b>
<b>Criteria for Interpreting Score Reports</b> .....	<b>126</b>
<b>Reference</b> .....	<b>127</b>
<b>Appendix 7.A—ELA for Writing (Grades Four and Seven) Rubrics</b> .....	<b>128</b>
Grade Four Scoring Rubric .....	128
Grade Seven Scoring Rubric .....	131
<b>Appendix 7.B—Scale Score Distribution Tables</b> .....	<b>134</b>
<b>Appendix 7.C—Demographic Summaries</b> .....	<b>136</b>
<b>Appendix 7.D—Types of Score Reports</b> .....	<b>174</b>
<b>Chapter 8: Analyses</b> .....	<b>177</b>
<b>Background</b> .....	<b>177</b>
<b>Samples Used for the Analyses</b> .....	<b>178</b>
<b>Classical Item Analyses</b> .....	<b>178</b>
Multiple-choice Items .....	178
Writing Tasks .....	179
<b>Reliability Analyses</b> .....	<b>180</b>
Intercorrelations, Reliabilities, and SEMs for Reporting Clusters .....	181
Subgroup Reliabilities and SEMs .....	181
Conditional Standard Errors of Measurement .....	182
<b>Decision Classification Analyses</b> .....	<b>183</b>
Writing Score Reliability .....	184
Prompt and Rater Agreement Summary .....	185
<b>Validity Evidence</b> .....	<b>186</b>
Purposes of the CMA .....	186
The Constructs to Be Measured .....	187
Intended Test Population(s) .....	187
Validity Evidence Collected .....	188
Evidence Based on Response Processes .....	192
Evidence of Rater Reliability and Interrater Agreement .....	192
Evidence Based on Internal Structure .....	192
Evidence Based on Consequences of Testing .....	194
<b>IRT Analyses</b> .....	<b>194</b>
Post-Equating .....	194
Pre-Equating .....	195
IRT Model-Data Fit Analyses .....	195
Model-fit Assessment Results .....	197
Summaries of Scaled IRT <i>b</i> -values .....	198
Evaluation of Pre-equating .....	198
Equating Results .....	198
<b>Differential Item Functioning Analyses</b> .....	<b>198</b>
<b>References</b> .....	<b>201</b>

# Chapter 1: Introduction

---

## Background

In 1997 and 1998, the California State Board of Education (SBE) adopted content standards in four major content areas: English–language arts (ELA), mathematics, history–social science, and science. These standards are designed to provide state-level input into instruction curricula and serve as a foundation for the state’s school accountability programs.

In order to measure and evaluate student achievement of the content standards, the state instituted the Standardized Testing and Reporting (STAR) Program. This Program, administered annually, was authorized in 1997 by state law (Senate Bill 376).

During its 2013 administration, the STAR Program had four components:

- California Standards Tests (CSTs), produced for California public schools to assess the California content standards for ELA, mathematics, history–social science, and science in grades two through eleven
- California Modified Assessment (CMA), an assessment of students’ achievement of California’s content standards for ELA, mathematics, and science, developed for students with an individualized education program (IEP) who meet the CMA eligibility criteria approved by the SBE
- California Alternate Performance Assessment (CAPA), produced for students with an IEP and who have significant cognitive disabilities and are not able to take the CSTs with accommodations and/or modifications or the CMA with accommodations
- Standards-based Tests in Spanish (STS), an assessment of students’ achievement of California’s content standards for Spanish-speaking English learners that is administered as the STAR Program’s designated primary language test (DPLT)

## Test Purpose

The purposes of the CMA are to allow students with disabilities greater access to an assessment that helps measure their achievement with respect to California’s content standards and to provide information about how well schools and school districts are meeting state and federal accountability requirements regarding ELA, mathematics, and science.

CMA results for ELA and mathematics in grades three through eight are used in calculating school and district Academic Performance Index (API) and Adequate Yearly Progress (AYP), which apply toward meeting the requirement of the federal Elementary and Secondary Education Act (ESEA) that all students score at the proficient level or above by 2014.

## Test Content

The CMA are administered in three content areas: ELA, mathematics, and science. Students in grades three through eleven are tested in ELA; students in grades three through seven are tested in grade-level mathematics; students who meet the end-of-course (EOC) criteria in grades seven through eleven are tested in EOC Algebra I; students who meet the EOC criteria in grades eight through eleven are tested in EOC Geometry; and students in

grades five, eight, and ten are tested in grade-level science. Students who take the CMA for ELA in grades four and seven also take an associated writing test (essay).

In 2013, the CMA included the following tests:

- English–Language Arts (grades three through eleven)
- Mathematics (grades three through seven)
- Algebra I (grades seven through eleven)
- Geometry (grades eight through eleven)
- Science (grades five and eight)
- Life Science (grade ten)

## Intended Population

All students enrolled in grades two through eleven in California public schools on the day testing begins are required to take the CSTs, the CMA (available for students in grades three through eleven in ELA, grades three through seven in mathematics, EOC Algebra I, and Geometry, and grades five, eight, and ten in science), or the CAPA. This requirement includes English learners regardless of the length of time they have been in U.S. schools or their fluency in English, as well as students with disabilities who receive special education services. For students with cognitive disabilities, the decision to administer the CSTs, the CMA, or the CAPA is made by their IEP team.

The CMA are designed for students with an IEP who meet eligibility criteria adopted by the SBE. The decision to administer the CMA is made by a student’s IEP team. The student’s IEP team makes the decision annually by evaluating the student’s progress on multiple measures. The IEP team must specify annually the CMA content area(s) the student is assigned to take. In addition, to be eligible to take the CMA, the student must have scored at the below basic or far below basic performance level on a previously administered CST.

Parents may submit a written request to have their child exempted from taking any or all parts of the tests within the STAR Program. For the ELA tests in grades four and seven, parents can submit a written request to have their child exempted from taking the essay associated with the ELA test. Only students whose parents submit a written request may be exempted from taking the tests (*Education Code [EC] Section 60615*).

## Intended Use and Purpose of Test Scores

The results for tests within the STAR Program are used for three primary purposes, described as follows (excerpted from the *EC Section 60602 Web page* at <http://www.leginfo.ca.gov/cgi-bin/displaycode?section=edc&group=60001-61000&file=60600-60603>): [Note: the preceding Web address is no longer valid.]

“60602. (a) (1) First and foremost, provide information on the academic status and progress of individual pupils to those pupils, their parents, and their teachers. This information should be designed to assist in the improvement of teaching and learning in California public classrooms. The Legislature recognizes that, in addition to statewide assessments that will occur as specified in this chapter, school districts will conduct additional ongoing pupil diagnostic assessment and provide information regarding pupil performance based on those assessments on a regular basis to parents or guardians and schools. The Legislature further recognizes that local diagnostic assessment is a primary mechanism through which academic strengths and weaknesses are identified.”

“60602. (a) (4) Provide information to pupils, parents or guardians, teachers, schools, and school districts on a timely basis so that the information can be used to further the development of the pupil and to improve the educational program.”

“60602. (c) It is the intent of the Legislature that parents, classroom teachers, other educators, governing board members of school districts, and the public be involved, in an active and ongoing basis, in the design and implementation of the statewide pupil assessment program and the development of assessment instruments.”

“60602. (d) It is the intent of the Legislature, insofar as is practically feasible and following the completion of annual testing, that the content, test structure, and test items in the assessments that are part of the Standardized Testing and Reporting Program become open and transparent to teachers, parents, and pupils, to assist all the stakeholders in working together to demonstrate improvement in pupil academic achievement. A planned change in annual test content, format, or design, should be made available to educators and the public well before the beginning of the school year in which the change will be implemented.”

In addition, STAR Program assessments are used to provide data for school, district, and state purposes and to meet federal accountability requirements.

## Testing Window

The CMA are administered within a 25-day window which begins 12 instructional days before and ends 12 instructional days after the day on which 85 percent of the instructional year is completed. School districts may use all or any part of the 25 days for testing but are encouraged to schedule testing over no more than a 10- to 15-day period. (California *Code of Regulations [CCR]*, Title 5, Education, Division 1, Chapter 2, Subchapter 3.75, Article 2, § 855; in the California Department of Education [CDE] Web document linked at <http://www.cde.ca.gov/ta/tg/sr/admin.asp>)

## Significant STAR Developments in 2013

### Forms Reuse

Test forms from previous STAR administrations from different years were reused during the 2013 administration to facilitate Quick-turnaround Reporting (QTR). There was no new item development for grades three through eight 2013 forms, so these forms did not contain new field-test items. However, new field-test items were embedded in the CMA for ELA in grades ten and eleven, end-of-course (EOC) Algebra I and Geometry, and grade ten Life Science.

### Pre-equating and the Implementation of Quick-turnaround Reporting

Because test forms were pre-equated, the raw-score-to-scale-score conversion tables were developed before tests were administered and the writing scores were not included with the multiple-choice scores for students in grades four and seven, so individual student results were available within approximately ten days of processing the school district’s scorable testing materials. A new Web application, called the Quick-turnaround Reporting module, was added to the STAR Management System; this module permitted districts to securely download a file containing these results.

### Changes to the ELA Reporting Clusters and Score Calculation in Grades Four and Seven

“Writing Applications” is no longer a reporting cluster. The writing task now yields a separate writing response score that is not included in the CMA for ELA results for students in grades

four and seven. Scale scores and performance levels reported on STAR Student Reports, other individual reports, aggregate reports, as well as results tables in this technical report, include data from multiple-choice tests only.

### **Number of Available Test Versions**

The number of versions for the grade-level tests in grades three through eight was reduced to three.

## **Limitations of the Assessment**

### **Score Interpretation**

Teachers and administrators should not use STAR results in isolation to make inferences about instructional needs. In addition, it is important to remember that a single test can provide only limited information. Other relevant information should be considered as well. It is advisable for parents to evaluate their child's strengths and weaknesses in the relevant topics by reviewing local assessments, classroom tests, student grades, classroom work, and teacher recommendations in addition to the child's CMA results (CDE, 2013). It is also important to note that student scores in a content area contain measurement error and could vary if students were retested.

### **Out-of-Level Testing**

Each CMA is designed to measure the content corresponding to a specific grade or course and is appropriate for students in the specific grade or course. Testing below a student's grade is not allowed for the CMA or any test in the STAR Program; all students are required to take the test for the grade in which they are enrolled. School districts are advised to review all IEPs to ensure that any provision for testing below a student's grade level has been removed.

### **Score Comparison**

When comparing scale score results for the CMA, the reviewer is limited to comparing results only within the same content area and grade. For example, it is appropriate to compare scores obtained by students and/or schools on the 2013 grade three mathematics test; it would not be appropriate to compare scores obtained on the grade three mathematics test with those obtained on the grade four mathematics test. The reviewer may compare results for the same content area and grade, within a school, between schools, or between a school and its district, its county, or the state within the same year or to previous years. Comparisons between scores obtained in different grades or content areas should be avoided.

Finally, it is inappropriate to conduct any type of score comparisons (including raw score, percent correct, scale score, or performance level comparisons) between CST and CMA tests. The CMA follows an independent procedure for test development and establishment of performance levels; therefore, comparison between CMA and CST results is discouraged.

## **Groups and Organizations Involved with the STAR Program**

### **State Board of Education**

The SBE is the state education agency that sets education policy for kindergarten through grade twelve in the areas of standards, instructional materials, assessment, and accountability. The SBE adopts textbooks for kindergarten through grade eight, adopts regulations to implement legislation, and has the authority to grant waivers of the *EC*.

The SBE is responsible for assuring the compliance with programs that meet the requirement of the federal ESEA and the state's Public School Accountability Act (PSAA) and for reporting results in terms of the AYP and API, which measure the academic performance and growth of schools on a variety of academic measures. In order to provide information on student progress in public schools, as essential for those programs, the SBE supervises the administration and progress of the STAR Program.

## **California Department of Education**

The CDE oversees California's public school system, which is responsible for the education of more than 6,200,000 children and young adults in more than 9,800 schools. California aims to provide a world-class education for all students, from early childhood to adulthood. The Department of Education serves California by innovating and collaborating with educators, schools, parents, and community partners which together, as a team, prepares students to live, work, and thrive in a highly connected world.

## **Contractors**

### **Educational Testing Service**

The CDE and the SBE contract with ETS to develop and administer the STAR Program. As the prime contractor, ETS has overall responsibility for working with the CDE to implement and maintain an effective assessment system and to coordinate the work of ETS and its subcontractor Pearson. Activities directly conducted by ETS include the following:

- Overall management of the program activities;
- Development of all test items;
- Construction and production of test booklets and related test materials;
- Support and training provided to counties, school districts, and independently testing charter schools;
- Implementation and maintenance of the STAR Management System for orders of materials and pre-identification services; and
- Completion of all psychometric activities.

### **Pearson**

ETS also monitors and manages the work of Pearson, subcontractor to ETS for the STAR Program. Activities conducted by Pearson include the following:

- Production of all scannable test materials;
- Packaging, distribution, and collection of testing materials to school districts and independently testing charter schools;
- Scanning and scoring of all responses, including performance scoring of the writing responses; and
- Production of all score reports and data files of test results.

## **Overview of the Technical Report**

This technical report addresses the characteristics of the CMA administered in spring 2013. The technical report contains nine additional chapters as follows:

- Chapter 2 presents a conceptual overview of processes involved in a testing cycle for a CMA. This includes test construction, test administration, generation of test scores, and dissemination of score reports. Information about the distributions of scores aggregated by subgroups based on demographics and the use of special services is included, as

are references to various chapters that detail the processes briefly discussed in this chapter.

- Chapter 3 describes the procedures followed during the development of valid CMA items. The chapter also explains the process of field-testing new items and the review of items by contractors and content experts.
- Chapter 4 details the content and psychometric criteria that guided the construction of the CMA before the 2013 administration; in 2013, because the test forms from previous STAR administrations from different years were reused, there were no new CMA forms constructed.
- Chapter 5 presents the processes involved in the actual administration of the 2013 CMA with an emphasis on efforts made to ensure standardization of the tests. It also includes a detailed section that describes the procedures that were followed by ETS to ensure test security.
- Chapter 6 describes the standard-setting process previously conducted for newly introduced CMA.
- Chapter 7 details the types of scores and score reports that are produced at the end of each administration of the CMA and includes a discussion of quick-turnaround reporting.
- Chapter 8 summarizes the results of the test- and item-level analyses performed during the spring 2013 administration of the tests. These include the classical item analyses, the reliability analyses that include assessments of test reliability and the consistency and accuracy of the CMA performance-level classifications, and the procedures designed to ensure the validity of CMA score uses and interpretations. Also discussed in this chapter are the item response theory (IRT) and model-fit analyses, documentation of the equating, CMA conversion tables, and the considerations and processes involved in pre-equating. Finally, for the CMA for ELA in grades nine through eleven, the CMA for Life Science (Grade 10), and the EOC CMA for Algebra I and Geometry, the chapter summarizes the results of analyses investigating the differential item functioning (DIF).
- Chapter 9 highlights the importance of controlling and maintaining the quality of the CMA.
- Chapter 10 presents historical comparisons of various item- and test-level results for the past three years and for the base year, which vary according to test.

Each chapter contains summary tables in the body of the text. However, extended appendixes that give more detailed information are provided at the end of the relevant chapters.

## Chapter 2: An Overview of CMA Processes

---

This chapter provides an overview of the processes involved in a typical test development and administration cycle for the CMA. Also described are the specifications maintained by ETS to implement each of those processes. Starting from the 2013 administration, test forms from previous STAR administrations from different years were reused, and pre-equating was implemented to facilitate Quick-turnaround Reporting (QTR). The changes in test development and administration processes are noted in addition to the processes that were used to develop the 2013 forms prior to their first use.

The chapter is organized to provide a brief description of each process followed by a summary of the associated specifications. More details about the specifications and the analyses associated with each process are described in other chapters that are referenced in the sections that follow.

### Item Development

#### Item Formats

All tests of the CMA contain three-option multiple-choice items. The CMA for ELA in grades four and seven have an associated constructed response component, the CMA for Writing, which contains one writing task. Starting with the 2013 administration, the score for the writing task is not included in the ELA results.

#### Item Specifications

The CMA items were developed to measure California content standards and designed to conform to principles of item writing defined by ETS (ETS, 2002). ETS maintained and updates an item specifications document, otherwise known as “item writer guidelines,” for each CMA and used an item utilization plan to guide the development of the items for each content area. Item writing emphasis was determined in consultation with the CDE.

The item specifications described the characteristics of the items that should be written to measure each content standard; items of the same type should consistently measure the content standards in the same way. The item specifications helped ensure that the items on the CMA measure the content standards in the same way. To achieve this, the item specifications provided detailed information to item writers who developed items for the CMA.

The items selected for the CMA undergo an extensive item review process that is designed to provide the best standards-based tests possible. Details about the item specifications, the item review process, and the item utilization plan are presented in Chapter 3, starting on page 60.

#### Item Banking

Before newly developed items were placed in the item bank, ETS prepared them for review by content experts and various external review organizations such as the Assessment Review Panels (ARPs), described in Chapter 3, starting on page 64; and the Statewide Pupil Assessment Review (SPAR) panel, described in Chapter 3, starting on page 67.

Once the ARP review was complete, the items were placed in the item bank along with the associated information obtained at the review sessions. Items that were accepted by the content experts were updated to a “field-test ready” status. ETS then delivered the items to the CDE by means of a delivery of the California electronic item bank. Items were subsequently field-tested to obtain information about item performance and item statistics

that could be used to assemble operational forms. The CDE then reviewed the item data and made decisions about which items could be used operationally (see page 69 for more information about the CDE's data review). Any additional updates to item content and statistics were based on data collected from the operational use of the items. However, only the latest content of the item is retained in the bank at any time, along with the administration data from every administration that has included the item.

Further details on item banking are presented on page 69 in Chapter 3.

### **Item Refresh Rate**

Prior to form reuse in the 2013 administration, the item utilization plan assumed that each year, 30 percent of items on an operational form were refreshed (replaced); these items remained in the item bank for future use.

## **Test Assembly**

### **Test Length**

The number of operational items in each CMA varies by content area and grade. There are 48 operational items on the CMA for ELA in grades three through five, the CMA for mathematics in grades three through five, and the CMA for science in grade five. There are 54 operational items on the CMA for ELA in grades six through eight, for mathematics in grades six and seven, and for science in grade eight. There are 60 operational items on the CMA for ELA in grades nine through eleven, the CMA for Algebra I and Geometry, and the CMA for Life Science in grade ten. The considerations used in deciding the test length are described on page 72 in Chapter 4.

Each CMA also includes a various number of field-test items in addition to the operational items. Although there was no new item development for the 2013 administration for the CMA for ELA in grades three through eight, the CMA for mathematics in grades three through seven, and the CMA for science in grades five and eight, the field-test items were included as part of the intact reused forms. The total number of items, including field-test items, in each CMA and the estimated time to complete a test are presented in Appendix 2.A on page 20.

### **Test Blueprints**

ETS selects all CMA items to conform to the SBE-approved California content standards and test blueprints. The test blueprints for the CMA can be found on the CDE STAR CMA Blueprints Web page at <http://www.cde.ca.gov/ta/tg/sr/cmablueprints.asp>.

Although the test blueprints specify the number of items at the individual standard level, scores for the CMA items are grouped into subcontent areas referred to as "reporting clusters." For each CMA reporting cluster, the percentage of questions correctly answered is reported on a student's score report. A description of the CMA reporting clusters and the standards that comprise each cluster are provided in Appendix 2.B, which starts on page 21.

### **Content Rules and Item Selection**

Test forms from previous STAR administrations from different years were reused during the 2013 administration to facilitate QTR. (See Table 8.4 on page 190 for administration years.) Prior to the 2013 administration, test developers followed a number of rules when developing a new test form for a given grade and content area. First and foremost, they selected items that met the blueprint for that grade and content area. Using an electronic item bank, assessment specialists began by identifying a number of linking items. These

were items that had appeared in previous operational test administrations and were then used to equate subsequent (new) test forms. After the linking items were approved, assessment specialists populated the rest of the test form.

Linking items were selected to proportionally represent the full blueprint. Each CMA form was a collection of test items designed to reflect a reliable, fair, and valid measure of student learning within well-defined course content.

Another consideration was the difficulty of each item. Test developers strived to ensure that there were some easy and some hard items and that there were a number of items in the middle range of difficulty. The detailed rules are presented in Chapter 4, which begins on page 72.

### **Psychometric Criteria**

The staff assesses the projected test characteristics during the preliminary review of the assembled forms. The statistical targets used to develop the 2013 forms and the projected characteristics of the assembled forms are presented in Chapter 4, starting on page 73.

The items in test forms are organized and sequenced differently according to the requirements of the content area. Further details on the arrangement of items during test assembly are also described on page 76 in Chapter 4.

All the forms in the 2013 CMA administration were used in prior operational STAR administrations. See Table 8.4 on page 190 for the list of the administration in which each CMA was originally administered.

### **Test Administration**

It is of utmost priority to administer the CMA in an appropriate, consistent, secure, confidential, and standardized manner.

### **Test Security and Confidentiality**

All tests within the STAR Program are secure documents. For the CMA administration, every person having access to test materials maintains the security and confidentiality of the tests. ETS's Code of Ethics requires that all test information, including tangible materials (such as test booklets, test questions, test results), confidential files, processes, and activities are kept secure. To ensure security for all tests that ETS develops or handles, ETS maintains an Office of Testing Integrity (OTI). A detailed description of the OTI and its mission is presented in Chapter 5 on page 99.

In the pursuit of enforcing secure practices, ETS and the OTI strive to safeguard the various processes involved in a test development and administration cycle. Those processes are listed below. The practices related to each of the following processes are discussed in detail in Chapter 5, starting on page 99.

- Test development
- Item and data review
- Item banking
- Transfer of forms and items to the CDE
- Security of electronic files using a firewall
- Printing and publishing
- Test administration

- Test delivery
- Processing and scoring
- Data management
- Transfer of scores via secure data exchange
- Statistical analysis
- Reporting and posting results
- Student confidentiality
- Student test results

## Procedures to Maintain Standardization

The CMA processes are designed so that the tests are administered and scored in a standardized manner. ETS takes all necessary measures to ensure the standardization of the CMA, as described in this section.

### Test Administrators

The CMA are administered in conjunction with the other tests that comprise the STAR Program. ETS employs personnel who facilitate various processes involved in the standardization of an administration cycle.

Staff at school districts who are central to the processes include district STAR coordinators, test site coordinators, test examiners, proctors, and scribes. The responsibilities of each of the staff members are included in the *STAR District and Test Site Coordinator Manual* (CDE, 2013); see page 104 in Chapter 5 for more information.

### Test Directions

A series of instructions compiled in detailed manuals is provided to the test administrators. Such documents include, but are not limited to, the following:

***Directions for Administration (DFAs)***—Manuals used by test examiners to administer the CMA to students to be followed exactly so that all students have an equal opportunity to demonstrate their academic achievement (See page 105 in Chapter 5 for more information.)

***District and Test Site Coordinator Manual***—Test administration procedures for district STAR coordinators and test site coordinators (See page 105 in Chapter 5 for more information.)

***STAR Management System manuals***—Instructions for the Web-based modules that allow district STAR coordinators to set up test administrations, order materials, and submit and correct student Pre-ID data; every module has its own user manual with detailed instructions on how to use the STAR Management System (See page 106 in Chapter 5 for more information.)

## Test Variations and Accommodations

All public school students participate in the STAR Program, including students with disabilities and English learners. Most students with IEPs and most English learners take the CMA under standard conditions. However, some students with IEPs and some English learners may need assistance when taking the CMA. This assistance takes the form of test variations or accommodations. All students in these categories may have test administration directions simplified or clarified.

All eligible students may have test variations if these variations are regularly used in the classroom. Each student also must be allowed to use the accommodations that are specified in his or her IEP or Section 504 plan. Accommodations change the way the test is given but do not change what is tested. These accommodations must match the one(s) used for classroom work throughout the year.

The purpose of test variations and accommodations is to enable the students to take the CMA, not to give them an advantage over other students or to artificially inflate their scores. Test administration variations and accommodations do not result in changes to the students' scores for API or AYP calculations. Appropriate test variations and accommodations for the 2013 administration of the California Modified Assessment are based on the study of item format and delivery mode from the California Modified Assessment Pilot Test.

Test variations and accommodations for the statewide assessments, including the STAR Program, are defined as follows:

**Category 1: Test Variations**—Eligible students may have test variations if regularly used in the classroom. For example, students may take a test in a group smaller than the regular testing group or take the test individually. They also may use special lighting, adaptive furniture, or magnifying equipment.

**Category 2: Accommodations**—Eligible students are permitted to take the CMA with accommodations if specified in their IEP or Section 504 plan for use on the CMA or for use during classroom instruction and assessment. Examples of accommodations are large-print or braille versions of the CMA or providing more than one day for a test designed for a single sitting.

Appendix 2.C on page 24 presents an adaptation of the 2013 Matrix of Test Variations, Accommodations, and Modifications for Administration of California Statewide Assessments; this version shows the complete list of the variations and accommodations that were allowed for the CMA in 2013. Because the CMA were developed with modifications built into the test, additional modifications are not allowed. Students who require additional modifications take the content-area CST with modifications.

### Special Services Summaries

The percentage of students using various testing accommodations during the 2013 administration of the CMA is presented in Appendix 2.D, which starts on page 27. The data are organized into two sections within each table. The first section presents the percentages of students using each accommodation in the total testing population. The second section presents the results for students in various categories based on the following levels of English-language fluency:

- **English only (EO)**—A student for whom there is a report of English as the primary language (i.e., language first learned, most frequently used at home, or most frequently spoken by the parents or adults in the home) on the “Home Language Survey”
- **Initially fluent English proficient (I-FEP)**—A student whose primary language is a language other than English who initially met the school district criteria for determining proficiency in English
- **English learner (EL)**—A student who first learned or has a home language other than English who was determined to lack sufficient fluency in English on the basis of state oral language (K–12) and literacy (3–12) assessments to succeed in the school’s regular instructional program (For students tested for initial classification prior to May

2001, this determination is made on the basis of the state-approved instrument the district was using. For students tested after May 2001, use the California English Language Development Test [CELDT] results.)

- **Reclassified fluent English proficient (R-FEP)**—A student whose primary language is a language other than English who was reclassified from English learner to fluent-English proficient

The information within each section is presented for the relevant grades. Most variations and accommodations are common across the CMA, although the CMA for grades four and seven ELA also include variations and accommodations related to the writing tasks. Additional accommodations are included for the CMA for mathematics that involved the use of calculators and for the CMA for science and mathematics that involved the use of manipulatives.

## Scores

The CMA total test raw scores equal the sum of examinees' scores on the operational multiple-choice test items. In grades four and seven, students also receive a separate score for the writing task; the score was separated from the total ELA score in 2013 to allow for early ELA student results to be reported via Quick-turnaround Reporting (QTR). The writing score is reported on a scale with possible scores of 0, 1, 2, 3, and 4. Details about CMA writing scores and scoring rubrics are described starting on page 117 in Chapter 7.

Total test raw scores on each CMA are converted to three-digit scale scores using the pre-equating process described starting on page 14. CMA results are reported through the use of these scale scores; the scores range from 150 to 600 for each test. Also reported are performance levels obtained by categorizing the scale score into one of the following levels: far below basic, below basic, basic, proficient, or advanced. Scale scores of 300 and 350 correspond to the cut scores for the basic and proficient performance levels, respectively. The state's target is for all students to score at the proficient or advanced level.

In addition to scale scores for the total content-area test, performance on the associated reporting clusters is reported. The subscore or reporting cluster score is obtained by summing an examinee's scores on the items in each reporting cluster. That information is reported in terms of a percent-correct score.

Detailed descriptions of CMA scores are found in Chapter 7, which starts on page 115.

## Aggregation Procedures

In order to provide meaningful results to the stakeholders, CMA scores for a given grade and content area are aggregated at the school, independently testing charter school, district, county, and state levels. The aggregated scores are generated for both individual students and demographic subgroups. The following sections present the summary results of individual and demographic subgroup CMA scores aggregated at the state level.

Please note that aggregation is performed on valid scores only, which are cases where examinees met all of the following criteria:

1. Met attemptedness criteria.
2. Did not have a parental exemption.
3. Did not miss any part of the test due to illness or medical emergency.
4. Identified, in the case of the end-of-course Algebra I or Geometry tests, the particular test taken.

5. Did not test out of level (grade inappropriate).

### **Individual Scores**

Table 7.1 and Table 7.2, starting on page 121 in Chapter 7, provide summary statistics for individual scores aggregated at the state level, describing overall student performance on each CMA. Included in the tables are the means and standard deviations of student scores expressed in terms of both raw scores and scale scores; the raw score means and standard deviations expressed as percentages of the total raw score points in each test; and the percentages of students in each performance level.

Statistics summarizing CMA student performance by content area and grade are provided in Table 7.B.1 through Table 7.B.4 starting on page 134 in Appendix 7.B.

### **Demographic Subgroup Scores**

In Table 7.C.1 through Table 7.C.19, starting on page 136, students are grouped by demographic characteristics, including gender, ethnicity, English-language fluency, economic status, and primary disability. The tables show the numbers of students with valid scores in each group, scale score means and standard deviations, and percent in a performance level, as well as percent correct for each reporting cluster for each demographic group. Table 7.3 on page 122 provides definitions for the demographic groups included in the tables.

### **Post-Equating**

Prior to the 2013 administration, the CMA were equated to a reference form using a common-item nonequivalent groups data collection design and methods based on item response theory (IRT) (Hambleton & Swaminathan, 1985). The “base” or “reference” calibrations for the CMA were established by calibrating samples of item response data from a specific administration, through which item parameter estimates for the items in the reused forms were placed on the reference scale using a set of linking items selected from the previous year. Doing so established a scale to which subsequent item calibrations could be linked.

For ELA in grades three through five, mathematics in grades three through five, and science in grade five, the reference scales were established in 2009 and were based on the spring 2009 operational administration. For ELA in grades six through eight, mathematics in grades six and seven, and science in grade eight, the reference scales were established in 2010 and were based on the spring 2010 operational administration. For ELA in grade nine, EOC Algebra I, and Life Science in grade ten, the reference scales were established in 2011 and were based on the spring 2011 operational administration. Finally, for ELA in grades ten and eleven and Geometry, the reference scales were established in 2012 and were based on the spring 2012 operational administration.

The procedure used for post-equating the CMA involves three steps: item calibration, item scaling, and production of scoring tables. Each of those steps, as described below, was applied to all of the tests of the CMA.

### **Pre-Equating**

During the 2013 administration, because all the test forms were used in previous STAR operational administrations, pre-equating was conducted prior to administration of the tests. Based on the sample invariant property of item response theory (IRT), all the item parameter estimates were placed on the reference scale in their previous administrations through the post-equating procedure described above. Item parameters derived in such a

manner can be used to create raw-score-to-scale-score conversion tables prior to test administration.

During the 2013 administration, all CMA reused forms without any edits or replacement to items. Therefore, the conversion tables from previous administrations when the forms were originally used are directly applied to the current administration.

Table 8.4 on page 190 shows the years the forms were introduced for each test.

### Calibration

To obtain item calibrations during the initial administration of each form, a proprietary version of the PARSCALE program was used. The estimation process was constrained by setting a common discrimination value for all items equal to 1.0 / 1.7 (or 0.588) and by setting the lower asymptote for all multiple-choice items to zero. The resulting estimation is equivalent to the Rasch model for multiple-choice items and the Rasch partial credit model for polytomously scored items, which was used to obtain calibrations for the writing prompt in the CMA for ELA in grades four and seven. For the purpose of equating, only the operational items were calibrated for each test.

The PARSCALE calibrations were run in two stages following procedures used with other ETS testing programs. In the first stage, estimation imposed normal constraints on the updated prior-ability distribution. The estimates resulting from this first stage were used as starting values for a second PARSCALE run, in which the subject prior distribution was updated after each expectation maximization (EM) cycle with no constraints. For both stages, the metric of the scale is controlled by the constant discrimination parameters.

### Scaling

Prior to the 2013 administration, calibrations of the items were linked to the previously obtained reference scale estimates using linking items and the Stocking and Lord (1983) procedure. In the case of the one-parameter model calibrations, this procedure was equivalent to setting the mean of the new item parameter estimates for the linking set equal to the mean of the previously scaled estimates. As noted earlier, the linking set was a collection of items in a current test form that also appeared in the previous year's form and was scaled at that time.

The linking process was carried out iteratively by inspecting differences between the transformed new and old (reference) estimates for the linking items and removing items for which the item difficulty estimates changed significantly. Items with large weighted root-mean-square differences (WRMSDs) between item characteristic curves (ICCs) based on the old and new difficulty estimates were removed from the linking set. The differences are calculated using the following formula:

$$WRMSD = \sqrt{\sum_{j=1}^{n_g} w_j [P_n(\theta_j) - P_r(\theta_j)]^2} \quad (2.1)$$

where,

abilities are grouped into intervals of 0.005 ranging from –3.0 to 3.0,

$n_g$  is the number of intervals/groups,

$\theta_j$  is the mean of the ability estimates that fall in interval  $j$ ,

$w_j$  is a weight equal to the proportion of estimated abilities from the transformed new form in interval  $j$ ,

$P_n(\theta_j)$  is the probability of correct response for the transformed new form item at ability  $\theta_j$ , and

$P_r(\theta_j)$  is the probability of correct response for the old (reference) form item at ability  $\theta_j$ .

Based on established procedures, any linking items for which the WRMSD was greater than 0.125 were eliminated from the linking set. This criterion has produced reasonable results over time in similar equating work done with other testing programs at ETS.

### Scoring Table Production

Once the new item calibrations for each test were transformed to the base scale after items' initial administration, IRT procedures were used to transform the new form number-correct scores (raw scores) to their corresponding ability (theta). The ability estimates were then transformed to scale scores through linear transformation.

The procedure is based on the relationship between raw scores and ability (theta). For the CMA consisting entirely of  $n$  multiple-choice items, this is the well-known relationship defined in Lord (1980; equations 4–5):

$$\xi(\theta) = \sum_{i=1}^n P_i(\theta) \quad (2.2)$$

where,

$P_i(\theta)$  is the probability of a correct response to item  $i$  at ability  $\theta$ , and

$\xi(\theta)$  is the corresponding true score.

For 2013, the writing task for ELA in grades four and seven is reported separately and not included in the calculation of scale scores, so the equating procedure for tests consisting entirely of multiple-choice items is sufficient. However, for the administrations prior to 2013 when "Writing Applications" was a reporting cluster of ELA scale score in grades four and seven,  $\xi(\theta)$  is based on a sum of multiple-choice and constructed response essay items; the relationship could be defined as:

$$\xi(\theta) = \sum_{i=1}^{nmc} P_i(\theta) + \sum_{j=1}^{ncr} \sum_{x=1}^m s_{xj} P_{xj}(\theta) \quad (2.3)$$

where,

$nmc$  is the number of multiple-choice items in the test,

$ncr$  is the number of constructed response items in the test,

$m$  is the number of score categories for each constructed response item,

$s_{xj}$  is the value for score category  $x$  for the constructed response item  $j$ , and

$P_{xj}(\theta)$  is the probability that an examinee with ability  $\theta$  obtains score  $s_x$  on the constructed response item  $j$ . For each integer score  $\xi_n$  on the form after its original use, the procedure was used to first solve for the corresponding ability estimate using equation 2.2, except in the case of the grades four and seven ELA tests prior to 2013, where equation 2.3 is used. The ability estimates were then expressed in the reporting scale metric by applying linear transformation with the appropriate slope and intercept, using equation 2.4:

$$ScaleScore = Intercept + Slope \times \theta \quad (2.4)$$

where,

$\theta$  represents student ability.

The slope and intercept for each CMA were developed from the base forms using equations 2.5 and 2.6 because the basic and proficiency cut scores were required to be equal to 300 and 350, respectively.

$$\text{Slope} = \frac{350 - 300}{\theta_{\text{proficient}} - \theta_{\text{basic}}} \quad (2.5)$$

$$\text{Intercept} = 350 - \theta_{\text{proficient}} \times \left( \frac{350 - 300}{\theta_{\text{proficient}} - \theta_{\text{basic}}} \right) \quad (2.6)$$

where,

$\theta_{\text{proficient}}$  represents theta cut score for proficient on the base scale, and

$\theta_{\text{basic}}$  represents theta cut score for basic on the base scale.

Complete raw-score-to-scale-score conversion tables for the CMA are presented in Table 8.D.8 through Table 8.D.8 in Appendix 8.D, starting on page 275. The raw scores and corresponding rounded, transformed scale scores are listed in those tables. Data used are from the forms' original STAR administration.

For all of the CMA, regardless of when the form was administered, scale scores were adjusted at both ends of the scale so that the minimum reported scale score was 150 and the maximum reported scale score was 600. Raw scores of zero and perfect raw scores were assigned scale scores of 150 and 600, respectively.

The scale-score ranges defining the various performance levels are presented in Table 2.1.

**Table 2.1 Scale-Score Ranges for Performance Levels**

Content Area	CMA *	Far Below Basic	Below Basic	Basic	Proficient	Advanced	
English– Language Arts	3	150 – 227	228 – 299	300 – 349	350 – 396	397 – 600	
	4	150 – 240	241 – 299	300 – 349	350 – 406	407 – 600

	8	150 – 263	264 – 299	300 – 349	350 – 405	406 – 600	
	10 Life Science	150 – 250	251 – 299	300 – 349	350 – 409	410 – 600	

\* Numbers indicate grade-level tests.

### **Pre-Equating the Braille Versions of the CMA**

In some cases, it was not possible to translate all of the operational items contained in a CMA into braille. This situation required that a new conversion table be developed for the resulting shortened test. To obtain this table, the shortened test was equated to the full-length operational test for the year being used using the IRT equating methods described previously. This process ensured that the scaled cut scores established for the full-length test are used to classify students who take the shorter test.

In 2013, this process was applied to the CMA for ELA (Grade 3) because one item on this test could not be translated into braille.

## Appendix 2.C—2013 CMA Test Variations and Accommodations

**Table 2.C.1 Matrix of Test Variations and Accommodations for the CMA**

<b>1: Test Variation 2: Accommodation</b>	
Test administration directions that are simplified or clarified (does not apply to test questions)	ALL
Student marks in test booklet (other than responses) including highlighting	ALL For grade 3 marks must be removed to avoid scanning interference or transcribed.
Test students in a small group setting	ALL
Extra time on a test within a testing day	ALL
Test individual student separately, provided that a test examiner directly supervises the student	1
Visual magnifying equipment	1
Audio amplification equipment	1
Noise buffers (e.g., individual carrel or study enclosure)	1
Special lighting or acoustics; special or adaptive furniture	1
Colored overlay, mask, or other means to maintain visual attention	1
Manually Coded English (MCE) or American Sign Language (ASL) to present directions for administration (does not apply to test questions)	1
Student marks responses in test booklet and responses are transferred to a scorable answer document by an employee of the school, district, or nonpublic school	2
Student dictates multiple-choice question responses orally, or in MCE to a scribe, audio recorder, or speech-to-text converter for selected response items	2
Word processing software with spell and grammar check tools turned off for the essay responses (writing portion of the test)	2
Essay responses dictated orally or in MCE to a scribe, audio recorder, or speech-to-text converter and the student provides all spelling and language conventions	2
Assistive device that does not interfere with the independent work of the student on the multiple-choice and/or essay responses (writing portion of the test)	2
Braille transcriptions provided by the test contractor	2
Large-print versions or test items enlarged (not duplicated) to a font size larger than that used on large print versions	2
Test over more than one day for a test or test part to be administered in a single sitting	2
Supervised breaks within a section of the test	2
Administration of the test at the most beneficial time of day to the student	2
Test administered at home or in hospital by a test examiner	2

<b>1: Test Variation 2: Accommodation</b>	
MCE or ASL to present test questions and answer options	2 Math and Science
	2 ELA (excludes passages)
	2 Writing Task
Test questions and answer options read aloud to student or used audio CD presentation	2 Math and Science
	2 ELA (excludes passages)
	2 Writing Task
Calculator on the mathematics tests	2 Grade 5 only
Math manipulatives on the mathematics tests	2
Math manipulatives on the science tests	2
Unlisted Accommodation	Check with CDE prior to use

All = All students may be provided these test variations.

(1): Test Variation = Students may have these testing variations if regularly used in the classroom.

(2): Accommodation = Eligible students shall be permitted to take the examination/test with accommodations if specified in the eligible student's IEP or Section 504 plan for use on the examination, standardized testing, or for use during classroom instruction and assessment.

**Table 2.C.2 Matrix of Test Variations for English Learners for the CMA**

<b>Test Variations</b>	
Hear the test directions printed in the test administration manual translated into the student's primary language. Ask clarifying questions about the test directions in the student's primary language.	Variation Allowed
Additional supervised breaks within a testing day or following each section (STAR) within a test part provided that the test section is completed within a testing day. A test section is identified by a "STOP" at the end of it.	Variation Allowed
English learners (ELs) may have the opportunity to be tested separately with other ELs provided that the student is directly supervised by an employee of the school who has signed the test security affidavit and the student has been provided such a flexible setting as part of his/her regular instruction or assessment.	Variation Allowed
Access to translation glossaries/word lists (English-to-primary language). Glossaries/Word lists shall not include definitions or formulas.	Variation Allowed Math and Science
	Not Allowed ELA

## Appendix 2.D—Special Service Summary Tables

### Notes:

1. To improve clarity of tables presented in this section, the columns with total number of students using each service are labeled with the particular grade or test name for which the services were utilized. For example, the column with a heading of “Grade 3” in Table 2.D.1 presents the number of students using various special services on the CMA for ELA in grade three. The column with the heading of “Pct. of Total” in the same table represents the percent of students using a service out of the total number of test-takers.
2. The total number of test-takers is the total of students listed under “Any Accommodation or EL Variation” and those listed under “No Accommodation or EL Variation.”
3. The sum of the numbers of students across subgroups may not match exactly to the total testing population, due to the fact that only valid codes were chosen to identify these subgroups.

**Table 2.D.1 Special Service Summary for ELA, Grade Three**

<b>Special Service Summary for ELA, Grade Three</b>

## Chapter 3: Item Development

Test forms from previous STAR administrations from different years were reused during the 2013 administration to facilitate QTR. This reuse permitted score conversion tables from the previous administration to be used to look up student scores and performance levels, making individual student results available within approximately ten days of processing the school district's scorable testing materials. There was no new item development for the grades three through eight 2013 forms. However, new field-test items were developed for the CMA for ELA in grades ten and eleven, EOC mathematics for Algebra I and Geometry, and grade ten Life Science and were embedded in the 2013 forms for these tests.

The CMA items are developed to measure California's content standards and designed to conform to principles of item writing defined by ETS (ETS, 2002). Each CMA item on the 2013 tests, new or reused, went through a comprehensive development cycle as is described in Figure 3.1, below.

**Figure 3.1 The ETS Item Development Process for the STAR Program**

### Rules for Item Development

ETS maintains and updates item development specifications for each CMA and has developed an item utilization plan to guide the development of the items for each content area. Item writing emphasis is determined in consultation with the CDE.

#### Item Specifications

The item specifications describe the characteristics of the items that should be written to measure each content standard; items of the same type should consistently measure the content standards in the same way. To achieve this, the item specifications provided detailed information to item writers who developed items for the CMA. The specifications include the following:

- A full statement of each academic content standard, as defined by the SBE (CDE, 2009)
- A description of each content strand

- The expected depth of knowledge (DOK) measured by items written for each standard (coded as 1, 2, 3, or 4; items assigned a DOK of 1 are the least cognitively complex, items assigned a DOK of 3 are the most cognitively complex, and the code of 4 applies only to some writing tasks)
- The homogeneity of the construct measured by each standard
- A description of the kinds of item stems appropriate for multiple-choice items used to assess each standard
- A description of the kinds of distractors that are appropriate for multiple-choice items assessing each standard
- A description of appropriate data representations (such as charts, tables, graphs, or other illustrations) for mathematics and science items
- The content limits for the standard (such as one or two variables, maximum place values of numbers) for mathematics and science items
- A description of appropriate reading passages, if applicable, for ELA items
- A description of specific kinds of items to be avoided, if any (for example, items with any negative expressions in the stem, e.g., “Which of the following is NOT. . .”)

In addition, the ELA item specifications contain guidelines for passages used to assess reading comprehension and writing. These guidelines include the following:

- The acceptable ranges for passage length
- The expected distribution of passages by genre
- Guidelines for readability and cognitive load, using standards agreed to by the CDE and ETS
- Expected use of illustrations
- The target number of items that should follow each reading passage and each writing passage
- Appropriate readability levels for writing passages
- A list of topics to be avoided

### **Expected Item Ratio**

ETS prepared the item utilization plan for the development of CMA items. The plan includes strategies for developing items that permit coverage of all appropriate standards for all tests in each content area and at each grade level. ETS test development staff used this plan to determine the number of items to develop for each content area. For content areas for which item development has been halted, the item utilization plan is no longer used.

The item utilization plan assumes that after the first two operational administrations, 30 percent of items on an operational form would be refreshed (replaced) each year; these items would remain in the item bank for future use. The plan also declares that an additional five percent of the operational items are likely to become unusable because of normal attrition and notes that there is a need to focus development on “critical” standards, which are standards that are difficult to measure well or for which there are few usable items.

For all content areas except science, it is assumed that at least 75 percent of all field-tested items are expected to have acceptable field-test statistics and become candidates for use in operational tests. For science, it is expected that 60 percent of the items achieve this status.

ETS has developed field-test percentages and item counts for the CMA for ELA in grades nine through eleven, EOC mathematics CMA in Algebra I and Geometry, and the CMA for Life Science (Grade 10) that are shown in Table 3.1; the grade-level CMA for ELA in grades three through eight, mathematics in grades three through seven, and science in grades five and eight reused the field-test items on the previously used forms. The number of items to be field-tested for a given CMA is determined as a percent of the number of operational items. For example, there are 60 operational items on the CMA for ELA in grade nine; the number of items to be field-tested is 67 percent of 48, which is 40 items.

**Table 3.1 Field-test Percentages for the CMA**

Content Area	Number of Operational Items per Grade or Course	Percentage of Operational Form to Be Field Tested	Number of Items to Be Field-tested per Grade or Course
ELA for Grades 9–11	60	67%	40
Algebra I	60	67%	40
Geometry	60	67%	40
10 Life Science	60	100%	60

## Selection of Item Writers

### Criteria for Selecting Item Writers

The items for each CMA were developed by individual item writers with a thorough understanding of the California content standards. Applicants for item writing were screened by senior ETS content staff. Only those with strong content and teaching backgrounds were approved for inclusion in the training program for item writers. Because most of the participants were current or former California educators, they were particularly knowledgeable about the standards assessed by the CMA. All item writers met the following minimum qualifications:

- Possession of a Bachelor’s degree in the relevant content area or in the field of education with special focus on a particular content of interest; an advanced degree in the relevant content area is desirable
- Previous experience in writing items for standards-based assessments, including knowledge of the many considerations that are important when developing items to match state-specific standards
- Previous experience in writing items in the content areas covered by CMA grades and/or courses
- Familiarity, understanding, and support of the California content standards
- Current or previous teaching experience in California, when possible

### Item Review Process

The items selected for each CMA undergo an extensive item review process that is designed to provide the best standards-based tests possible. This section summarizes the various reviews performed that ensure the quality of the new CMA items and test forms for the CMA for ELA in grades nine through eleven, EOC mathematics CMA in Algebra I and Geometry, and the CMA for Life Science (Grade 10). See Table 8.4 on page 190 for the dates of the previous administrations.

## Contractor Review

Once the items have been written, ETS employs a series of internal reviews. The reviews establish the criteria used to judge the quality of the item content and are designed to ensure that each item is measuring what it is intended to measure. The internal reviews also examine the overall quality of the test items before they are prepared for presentation to the CDE and the Assessment Review Panels (ARPs). Because of the complexities involved in producing defensible items for high-stakes programs such as the STAR Program, it is essential that many experienced individuals review each item before it is brought to the CDE, the ARPs, and Statewide Pupil Assessment Review (SPAR) panels.

The ETS review process for the CMA includes the following:

1. Internal content review
2. Internal editorial review
3. Internal sensitivity review

Throughout this multistep item review process, the lead content-area assessment specialists and development team members continually evaluated the adherence to the rules for item development.

### 1. Internal Content Review

Test items and materials undergo two reviews by the content-area assessment specialists. These assessment specialists make sure that the test items and related materials are in compliance with ETS's written guidelines for clarity, style, accuracy, and appropriateness for California students as well as in compliance with the approved item specifications.

Assessment specialists review each item in terms of the following characteristics:

- Relevance of each item to the purpose of the test
- Match of each item to the item specifications, including DOK
- Match of each item to the principles of quality item writing
- Match of each item to the identified standard or standards
- Difficulty of the item
- Accuracy of the content of the item
- Readability of the item or passage
- Grade-level appropriateness of the item
- Appropriateness of any illustrations, graphs, or figures

Each item is classified with a code for the standard it is intended to measure. The assessment specialists check all items against their classification codes, both to evaluate the correctness of the classification and to ensure that the task posed by the item is relevant to the outcome it is intended to measure. The reviewers may accept the item and classification as written, suggest revisions, or recommend that the item be discarded. These steps occur prior to the CDE's review.

### 2. Internal Editorial Review

After the content-area assessment specialists review each item, a group of specially trained editors reviews each item in preparation for review by the CDE and the ARPs. The editors check items for clarity, correctness of language, appropriateness of language for the grade level assessed, adherence to the style guidelines, and conformity with accepted item-writing practices.

### 3. Internal Sensitivity Review

ETS assessment specialists who are specially trained to identify and eliminate questions that contain content or wording that could be construed to be offensive to or biased against members of specific ethnic, racial, or gender groups, conduct the next level of review. These trained staff members review every item before the CDE and ARP reviews.

The review process promotes a general awareness of and responsiveness to the following:

- Cultural diversity
- Diversity of background, cultural tradition, and viewpoints to be found in the test-taking populations
- Changing roles and attitudes toward various groups
- Role of language in setting and changing attitudes toward various groups
- Contributions of diverse groups (including ethnic and minority groups, individuals with disabilities, and women) to the history and culture of the United States and the achievements of individuals within these groups
- Item accessibility for English-language learners

### Content Expert Reviews

#### Assessment Review Panels

ETS was responsible for working with ARPs as items were developed for the CMA. The ARPs are advisory panels to the CDE and ETS and provide guidance on matters related to item development for the CMA. The ARPs were responsible for reviewing all newly developed items for alignment to the California content standards. The ARPs also reviewed the items for accuracy of content, clarity of phrasing, and quality. In their examination of test items, the ARPs could raise concerns related to age/grade appropriateness and gender, racial, ethnic, and/or socioeconomic bias.

#### Composition of ARPs

The ARPs comprise current and former teachers, resource specialists, administrators, curricular experts, and other education professionals. Current school staff members must meet minimum qualifications to serve on the CMA ARPs, including:

- Three or more years of general teaching experience in grades kindergarten through twelve and in the relevant content areas (ELA, mathematics, or science);
- Bachelor's or higher degree in a grade or content area related to ELA, mathematics, or science;
- Knowledge and experience with the California content standards in ELA, mathematics, or science;
- Special education credential;
- Experience with more than one type of disability; and
- Three to five years of experience as a teacher or school administrator with a special education credential.

School administrators, district/county content/program specialists, or university educators serving on the CMA ARPs must meet the following qualifications:

- Three or more years of experience as a school administrator, district/county content/program specialist, or university instructor in a grade-specific area or area related to ELA, mathematics, or science;

- Bachelor’s or higher degree in a grade-specific or content area related to ELA, mathematics, or science; and
- Knowledge of and experience with the California content standards in ELA, mathematics, or science.

Every effort is made to ensure that ARP committees include representation of gender and of the geographic regions and ethnic groups in California. Efforts are also made to ensure representation by members with experience serving California’s diverse special education population.

Current ARP members are recruited through an application process. Recommendations are solicited from school districts and county offices of education as well as from CDE and SBE staff. Applications are received and reviewed throughout the year. They are reviewed by the ETS assessment directors, who confirm that the applicant’s qualifications meet the specified criteria. Applications that meet the criteria are forwarded to CDE and SBE staff for further review and agreement on ARP membership. Upon approval, the applicant is notified that he or she has been selected to serve on the ARP committee.

Table 3.2 shows the educational qualifications, present occupation, and credentials of the current CMA ARP members.

**Table 3.2 CMA ARP Member Qualifications, by Content Area and Total**

<b>CMA</b>	<b>ELA</b>	<b>Math</b>	<b>Science</b>	<b>Total</b>

### **ARP Meetings for Review of New CMA Field-test Items**

For the 2013 STAR administration, the CMA ARP met to review new field-test items for the CMA for grades nine through eleven ELA, EOC mathematics for Algebra I and Geometry, and Life Science in grade ten only; the grade-level CMA for ELA in grades three through eight, mathematics in grades three through seven, and science in grades five and eight all reused the field-test items on the previously used forms.

ETS content-area assessment specialists facilitate the CMA ARP meetings. Each meeting begins with a brief training session on how to review items. ETS provides this training, which consists of the following topics:

- Overview of the purpose and scope of the CMA
- Overview of the CMA test design specifications and blueprints
- Analysis of the CMA item specifications
- Overview of criteria for evaluating multiple-choice test items and for reviewing constructed response writing tasks
- Review and evaluation of items for bias and sensitivity issues

The criteria for evaluating multiple-choice items and constructed response writing tasks include the following:

- Overall technical quality
- Match to the California content standards
- Match to the construct being assessed by the standard
- Difficulty range
- Clarity
- Correctness of the answer
- Plausibility of the distractors
- Bias and sensitivity factors

Criteria also include more global factors, including—for ELA—the appropriateness, difficulty, and readability of reading passages. The ARPs also are trained on how to make recommendations for revising items.

Guidelines for reviewing items are provided by ETS and approved by the CDE. The set of guidelines for reviewing items is summarized below.

Does the item:

- Have one and only one clearly correct answer?
- Measure the content standard?
- Match the test item specifications?
- Align with the construct being measured?
- Test worthwhile concepts or information?
- Reflect good and current teaching practices?
- Have a stem that gives the student a full sense of what the item is asking?
- Avoid unnecessary wordiness?
- Use response options that relate to the stem in the same way?
- Use response options that are plausible and have reasonable misconceptions and errors?
- Avoid having one response option that is markedly different from the others?
- Avoid clues to students, such as absolutes or words repeated in both the stem and options?
- Reflect content that is free of bias against any person or group?

Is the stimulus, if any, for the item:

- Required in order to answer the item?
- Likely to be interesting to students?
- Clearly and correctly labeled?
- Providing all the information needed to answer the item?

As the first step of the item review process, ARP members review a set of items independently and record their individual comments. The next step in the review process is for the group to discuss each item. The content-area assessment specialists facilitate the discussion and record all recommendations in a master item review booklet. Item review binders and other item evaluation materials also identify potential bias and sensitivity factors the ARP will consider as a part of its item reviews.

Depending on CDE approval and the numbers of items still to be reviewed, some ARPs are divided further into smaller groups. The science ARP, for example, divides into content-area and grade-level groups. These smaller groups are also facilitated by the content-area assessment specialists.

ETS staff maintains the minutes summarizing the review process and then forwards copies of the minutes to the CDE, emphasizing in particular the recommendations of the panel members.

### **Statewide Pupil Assessment Review Panel**

The SPAR panel is responsible for reviewing and approving all achievement test items to be used statewide for the testing of students in California public schools, grades two through eleven. At the SPAR panel meetings, all new items are presented in binders for review. The SPAR panel representatives ensure that the test items conform to the requirements of *EC* Section 60602. The constructed response writing tasks are also presented for review. If the SPAR panel rejects specific items and/or constructed response writing tasks, the items and/or tasks are marked for rejection in the item bank and excluded from use on field tests. For the SPAR panel meeting, the item development coordinator is available by telephone to respond to any questions during the course of the meeting.

## **Field Testing**

The primary purposes of field testing are to obtain information about item performance and to obtain statistics that can be used to assemble operational forms. In the 2013 STAR administration, new field-test items were introduced for the CMA for ELA in grades nine through eleven, EOC mathematics CMA for Algebra I and Geometry, and the CMA for Life Science (Grade 10). For the grade-level CMA for ELA in grades three through eight, mathematics in grades three through seven, and science in grades five and eight, field-test items were repeated as a part of the intact reused forms.

### **Stand-alone Field Testing**

For each new CMA launched, a pool of items was initially constructed by administering the newly developed items in a stand-alone field test. In stand-alone field testing, examinees were recruited to take tests outside of the usual testing circumstances, and the test results were typically not used for instructional or accountability purposes (Schmeiser & Welch, 2006).

CMA stand-alone field testing for each new test occurred in the fall before the test became operational in the following spring. In the case of writing prompts administered as part of the

grades four and seven CMA for ELA, due to time constraints, field-testing occurs every few years and was conducted only as stand-alone event.

The writing prompts for the 2013 administration of grades four and seven CMA for ELA were selected from the writing prompts field-tested by ETS in the fall of 2011. Before the field test, a task force was convened to provide an opportunity for representatives from the field and other specialists to recommend possible changes to the writing test that could be incorporated into the field tests. Six prompts were field-tested for grade four, and eight prompts were field-tested for grade seven to determine which of the modifications in format and directions recommended by the Writing Test Task Force were most helpful to students. These new writing prompts with modified formats and directions were field-tested with thousands of California students.

Following reviews of field test results by the CDE, ETS, and the ELA ARP, two grade-four and two grade-seven prompts were selected for the subsequent administrations.

The stand-alone field-testing timeline for the CMA is presented in Table 3.3.

**Table 3.3 Stand-alone Field-testing Timeline for the CMA**

\* Number indicates grade-level tests.

### Embedded Field-test Items

Although a stand-alone field test is useful for developing a new test because it can produce a large pool of quality items, embedded field testing is generally preferred because the items being field-tested are seeded throughout the operational test. Factors such as test-taker motivation and test security are the same in embedded field testing as they will be when the field-tested items are later administered operationally. Such field testing involves distributing the items being field-tested within an operational test form. Different forms contain the same core set of operational items and different sets of field-test items. The numbers of embedded field-test items for the CMA introduced during the 2013 STAR administration are shown in Table 3.4 on the next page.

## Allocation of Students to Forms

The test forms for a given CMA are spiraled among students in the state so that a large representative sample of test-takers responds to the field-test items embedded in these forms. The spiraling design ensures that a diverse sample of students takes each field-test item. The students do not know which items are field-test items and which items are operational items; therefore, their motivation is not expected to vary over the two types of items (Patrick & Way, 2008).

## Number of Forms and Sample Sizes

A set of field-test items is administered on the CMA forms for ELA in grades nine through eleven, EOC mathematics for Algebra I and Geometry, and Life Science in grade ten. The sets of field-test items differ across forms, and the number of forms and number of field-test items per form may vary across content area and grade level. As mentioned earlier, the number of items to be field-tested for a given CMA reflects the demand for new items.

Table 3.4 also shows the number of forms, operational items, field-test items, and the approximate number of students included in the P2 data. This P2 data file contained the entire test-taking population and all the student records used in the August 20, 2013, reporting of STAR results.

The field-test samples are listed in the last column of Table 3.4.

**Table 3.4 Summary of Items and Forms Presented in the 2013 CMA**

Content Area	CMA *	Operational		Field Test		
		No. Items	No. Examinees P2 Data †	No. Forms	No. Items	No. Examinees P2 Data †
English– Language Arts	9	60	21,430	4	40	5,244–5,511
	10	60	18,741	6	40	2,873–3,500
	11	60	16,128	4	40	3,966–4,115

\* Numbers indicate grade-level tests.

† Valid forms

## CDE Data Review

Once items for ELA in grades nine through eleven, EOC mathematics for Algebra I and Geometry, and Life Science in grade ten have been field-tested, ETS prepares the items and the associated statistics for review by the CDE. ETS provides items with their statistical data, along with annotated comment sheets, for the CDE to use in its review. ETS conducts an introductory training to highlight any new issues and serve as a statistical refresher. CDE consultants then make decisions about which items should be included in the item bank. ETS psychometric and content staff are available to CDE consultants throughout this process.

## Item Banking

Once the ARP new item review is complete, the items are placed in the item bank along with their corresponding review information. Items that are accepted by the ARP, SPAR, and CDE are updated to a “field-test ready” status; items that are rejected are updated to a “rejected before use” status. ETS then delivers the items to the CDE by means of a delivery

of the California electronic item bank. Subsequent updates to items are based on field-test and operational use of the items. However, only the latest content of the item is in the bank at any given time, along with the administration data from every administration that has included the item.

After field-test or operational use, items that do not meet statistical specifications may be rejected; such items are updated with a status of “rejected for statistical reasons” and remain unavailable in the bank. These statistics are obtained by the psychometrics group at ETS, which carefully evaluates each item for its level of difficulty and discrimination as well as conformance to the IRT Rasch model. Psychometricians also determine if the item functions similarly for various subgroups of interest.

All unavailable items are clearly marked with an availability indicator of “Unavailable,” a reason for rejection as described above, and cause alerts so they are not inadvertently included on subsequent test forms. Statuses and availability are updated programmatically as items are presented for review, accepted or rejected, placed on a form for field-testing, presented for statistical review, and used operationally. All rejection indications are monitored and controlled through ETS’s assessment development processes.

ETS currently provides and maintains the electronic item banks for several of the California assessments, including the California High School Exit Examination (CAHSEE), the California English Language Development Test (CELDT), and STAR (CST, CMA, CAPA, and STS). CAHSEE and STAR are currently consolidated in the California item banking system. ETS works with the CDE to obtain the data for assessments such as the CELDT, under contract with other vendors for inclusion into the item bank. ETS provides the item banking application using the LAN architecture and the relational database management system, SQL 2008, already deployed. ETS provides updated versions of the item bank to the CDE on an ongoing basis and works with the CDE to determine the optimum process if a change in databases is desired.

## Chapter 4: Test Assembly

---

The CMA are constructed to measure students' performance relative to California's content standards approved by the SBE. They are also constructed to meet professional standards for validity and reliability. For each CMA, the content standards and desired psychometric attributes are used as the basis for assembling the test forms.

### Test Length

The number of items in each CMA blueprint was determined by considering the construct that the test is intended to measure and the level of psychometric quality desired. Test length is closely related to the complexity of content to be measured by each test; this content is defined by the California content standards for each grade level and content area. Also considered is the goal that the test be short enough that most of the students complete it in a reasonable amount of time.

The number of operational items on each CMA varies across grades and content areas. There are 48 operational items on the CMA for ELA in grades three through five, for mathematics in grades three through five, and for science in grade five. There are 54 operational items on the CMA for ELA in grades six through eight, for mathematics in grades six and seven, and for science in grade eight. There are 60 operational items on the CMA for ELA in grades nine through eleven, Algebra I and Geometry, and Life Science in grade ten. In addition, a writing test (essay) is administered in association with the CMA for ELA in grades four and seven.

The total number of items also varies. There are 57 items on the CMA for ELA in grades three through five, for mathematics in grades three through five, and for science in grade five. There are 63 items on the CMA for ELA in grades six through eight, for mathematics in grades six and seven, and for science in grade eight. There are 66 items on the CMA for Life Science in grade ten, and 70 items on the CMA for ELA in grades nine through eleven, Algebra I, and Geometry.

In addition to operational items, a certain number of the items on each test are field-test items. Specifically, there are nine field-test items for grade-level tests in grades three through eight; ten on the tests for ELA in grades nine through eleven and EOC Algebra I and Geometry; and six field-test items for Life Science in grade ten. For more details on the distribution of items, see Appendix 2.A—CMA Items and Estimated Time Chart starting on page 20.

### Rules for Item Selection

#### Test Blueprint

All test items on CMA forms were selected to conform to the SBE-approved California content standards and test blueprints. The content blueprints for the CMA can be found on the CDE STAR CMA Blueprints Web page at <http://www.cde.ca.gov/ta/tg/sr/cmablueprints.asp>.

Although the test blueprints call for the number of items at the individual standard level, scores for the CMA items are grouped into subcontent areas (reporting clusters). For each CMA reporting cluster, the percentage of questions correctly answered is reported on a student's score report. A list of the CMA reporting clusters by test and the number of items

in the cluster that appear in each test are provided in Appendix 2.B—Reporting Clusters, which starts on page 21.

## Content Rules and Item Selection

Test forms from previous STAR administrations from different years were reused during the 2013 administration to facilitate quick-turnaround reporting. Prior to the 2013 administration, test developers followed a number of rules when developing a new test form for a given grade and content area. First and foremost, they selected items that met the blueprint for that grade level and content area. Using an electronic item bank, assessment specialists began by identifying a number of linking items. These are items that appeared in the previous year's operational administration and are used to equate the test forms administered each year. Linking items are selected to proportionally represent the full blueprint. For example, if 25 percent of all of the items in a test are in the first reporting cluster, then 25 percent of the linking items should come from that cluster. The selected linking items are also reviewed by psychometricians to ensure that specific psychometric criteria are met.

After the linking items were approved, assessment specialists populated the rest of the test form. Their first consideration was the strength of the content and the match of each item to a specified content standard. In selecting items, team members also tried to ensure that they included a variety of formats and content and that at least some of the items included graphics for visual interest.

Another consideration was the difficulty of each item. Test developers strived to ensure that there were some easy and some hard items and that there were a number of items in the middle range of difficulty. If items did not meet all content and psychometric criteria, staff reviewed the other available items to determine if there were other selections that could improve the match of the test to all of the requirements. If such a match was not attainable, the content team worked in conjunction with psychometricians and the CDE to determine which combination of items would best serve the needs of the students taking the test. Chapter 3, starting on page 60, contains further information about this process.

## Psychometric Criteria

The three goals of CMA test development are as follows:

1. The test must have desired precision of measurement at all ability levels.
2. The test score must be valid and reliable for the intended population and for the various subgroups of test-takers.
3. The test forms must be comparable across years of administration to ensure the generalizability of scores over time.

In order to achieve these goals, a set of rules that outlines the desired psychometric properties of each CMA was developed. Such rules are referred to as statistical targets.

Two types of assembly targets were developed for each CMA: the total test target and (reporting) cluster targets. These targets were provided to test developers before a test construction cycle began. The test developers and psychometricians worked together to design the tests to these targets.

## Primary Statistical Targets

The total test targets, or primary statistical targets, used for assembling the CMA forms for the 2013 administration were the test information function (TIF) and an average point-biserial correlation.

The TIF is the sum of the item information function based on the item response theory (IRT) item parameters. When using an IRT model, the target TIF makes it possible to choose items to produce a test that has the desired precision of measurement at all ability levels.

The graphs for the total test are presented in Figure 4.A.1 through Figure 4.A.3, starting on page 78, for the ELA, mathematics, and science tests, respectively. These curves present the target TIF and the projected TIF for the total content area.

Due to the unique characteristics of the Rasch IRT model, the information curve conditional on each ability level is determined by item difficulty ( $b$ -values) alone. In this case, the TIF would, therefore, suffice as the target for conditional test difficulty. Although additional item difficulty targets are not imperative when the target TIF is used for form construction, the target mean and standard deviation of item difficulty consistent with the TIF were still provided to test development staff to help with the test construction process. The target  $b$ -value range approximates a minimum proportion-correct value ( $p$ -value) of 0.33 and a maximum  $p$ -value of 0.95 for each test.

The point-biserial correlation describes the relationship between student performance on a dichotomously scored item and student performance on the test as a whole. It is used as a measure of how well an item discriminates among test-takers who differ in their ability, and it is related to the overall reliability of the test.

The minimum target value for an item point biserial was set at 0.14 for each test. This value approximates a biserial correlation of 0.20.

### Assembly Targets

Table 4.1 shows the source of assembly targets for each CMA.

**Table 4.1 Matrix of Assembly Targets**

CMA Content Area			Source of Assembly Targets
ELA • Grade 3 • Grade 4 • Grade 5	Mathematics • Grade 3 • Grade 4 • Grade 5	Science • Grade 5	Analyses of spring 2009 operational forms
ELA • Grade 6 • Grade 7 • Grade 8	Mathematics • Grade 6 • Grade 7	Science • Grade 8	Analyses of spring 2010 operational forms
ELA • Grade 9	Mathematics • Algebra I	Science • 10 Life Science	Analyses of spring 2011 operational forms
ELA • Grade 10 • Grade 11	Mathematics • Geometry		The spring 2012 forms were reused for spring 2013. The statistics from the fall 2011 field-test administration were used for spring 2012 forms. The targets for these tests will be updated for future operational form construction with base-year statistics.

The target values for the CMA are presented in Table 4.2. These specifications were developed from the analyses of test forms administered starting from 2009 to the present as shown in the previous matrix.

**Table 4.2 Statistical Targets for CMA Test Assembly**

Content Area	CMA *	Point Biserial		b-value		p-value	
		Mean	Minimum	Mean	St. Dev.	Minimum	Maximum
English– Language Arts	3	0.37	0.14	–0.51	0.55	0.33	0.95
	4	0.37	0.14	–0.41	0.53	0.33	0.95
	5	0.37	0.14	–0.40	0.77	0.33	0.95
	6	0.35	0.14	–0.46	0.64	0.33	0.95
	7	0.35	0.14	–0.51	0.48	0.33	0.95
	8	0.35	0.14	–0.49	0.65	0.33	0.95
	9	0.30	0.14	–0.23	0.65	0.33	0.95
	10	0.30	0.14	–0.21	0.65	0.33	0.95
	11	0.30	0.14	–0.21	0.65	0.33	0.95
Mathematics	3	0.37	0.14	–0.43	0.75	0.33	0.95
	4	0.37	0.14	–0.40	0.76	0.33	0.95
	5	0.37	0.14	–0.38	0.78	0.33	0.95
	6	0.30	0.14	–0.44	0.52	0.33	0.95
	7	0.30	0.14	–0.49	0.50	0.33	0.95
	Algebra I Geometry	0.30	0.14	–0.23	0.50	0.33	0.95
Science	5	0.37	0.14	–0.43	0.74	0.33	0.95
	8	0.33	0.14	–0.46	0.50	0.33	0.95
	10 Life Science	0.30	0.14	–0.22	0.50	0.33	0.95

\* Numbers indicate grade-level tests.

Target information functions are also used to evaluate the items selected to measure each subscore in the interest of maintaining some consistency in the accuracy of cluster scores across years. Because the clusters include fewer items than the total test, there is always more variability between the target and the information curves constructed for the new form clusters than there is for the total test.

Figure 4.B.1 through Figure 4.B.16, starting on page 83, present the target and projected information curves for the clusters in the ELA, mathematics, and science tests, respectively.

### Projected Psychometric Properties of the Assembled Tests

Prior to the 2013 administration, ETS psychometricians performed a preliminary review of the technical characteristics of the assembled tests. The expected or projected performance of examinees and the overall score reliability were estimated using the item-level statistics available in the California item bank for the selected items. The test reliability was based on Gulliksen’s formula (Gulliksen, 1987) for estimating test reliability ( $r_{xx}$ ) from item  $p$ -values and item point-biserial correlations:

$$r_{xx} = \left( \frac{K}{K-1} \right) \left( 1 - \frac{\sum_{g=1}^K S_g^2}{\left( \sum_{g=1}^K r_{xg} S_g \right)^2} \right) \quad (4.1)$$

where,

$K$  is the number of items in the test,

$s_g^2$  is the estimated item variances, i.e.,  $p_g(1 - p_g)$ , where  $p_g$  is the item  $p$ -value for item  $g$ ,

$r_{xg}$  is the item point-biserial correlation for item  $g$ , and

$r_{xg} s_g$  is the item reliability index.

In addition, estimated test raw score means were calculated by summing the item  $p$ -values, and estimated test raw score standard deviations were calculated by summing the item reliability indices. Table 4.A.1 on page 78 presents these summary values by content area and grade.

It should be noted that the projected reliabilities in Table 4.A.1 were based on item  $p$ -values and point-biserial correlations that, for some of the items, were based on external field-testing using samples of students that were not fully representative of the state. Chapter 8 presents item  $p$ -values, point-biserial correlations, and test reliability estimates based on the data from the 2013 CMA administration.

Table 4.A.2 on page 78 shows the mean observed statistics of the items on each CMA based on the item-level statistics from the year the form was previously administered. See Table 8.4 on page 190 for the dates of the original administrations. These values can be compared to the target values in Table 4.2.

## Rules for Item Sequence and Layout

The items on test forms are organized and sequenced differently according to the requirements of the content area.

- **ELA**—Because the ELA test forms are primarily passage-dependent, items are sequenced with their associated reading passages. Passages are sequenced according to genre and interest level; test developers work to place high-interest pieces (typically narrative selections) near lower-interest pieces (typically functional or technical writing). Stand-alone items are placed throughout the form, where appropriate.
- **Mathematics**—The CMA mathematics test forms are sequenced mostly according to reporting cluster; that is, all items from a single reporting cluster are presented together, and then all of the items from the next reporting cluster are presented. There are three reporting clusters for the grade-level mathematics tests: Reporting cluster 1, which tests Number Sense; reporting cluster 2, which tests both Algebra and Functions and Statistics, Data Analysis, and Probability; and reporting cluster 3, which tests Measurement and Geometry. There are four reporting clusters for each of the EOC tests.
- **Science**—The science test forms are sequenced according to reporting cluster; that is, all items from a single reporting cluster are presented together and then all of the items from the next reporting cluster are presented. Items from the Investigation and Experimentation reporting cluster are an exception to this rule: these items assess aspects of practical knowledge in various clusters; they are presented with their associated clusters and then aggregated for reporting purposes as an Investigation and Experimentation cluster.

# Chapter 5: Test Administration

---

## Test Security and Confidentiality

All tests within the STAR Program are secure documents. For the CMA administration, every person having access to testing materials maintains the security and confidentiality of the tests. ETS's Code of Ethics requires that all test information, including tangible materials (such as test booklets), confidential files, processes, and activities are kept secure. ETS has systems in place that maintain tight security for test questions and test results, as well as for student data. To ensure security for all the tests that ETS develops or handles, ETS maintains an Office of Testing Integrity (OTI), which is described in the next section.

### ETS's Office of Testing Integrity

The OTI is a division of ETS that provides quality assurance services for all testing programs administered by ETS and resides in the ETS legal department. The Office of Professional Standards Compliance of ETS publishes and maintains *ETS Standards for Quality and Fairness*, which supports the OTI's goals and activities. The purposes of the *ETS Standards for Quality and Fairness* are to help ETS design, develop, and deliver technically sound, fair, and useful products and services, and to help the public and auditors evaluate those products and services.

The OTI's mission is to

- Minimize any testing security violations that can impact the fairness of testing
- Minimize and investigate any security breach
- Report on security activities

The OTI helps prevent misconduct on the part of test-takers and administrators, detects potential misconduct through empirically established indicators, and resolves situations in a fair and balanced way that reflects the laws and professional standards governing the integrity of testing. In its pursuit of enforcing secure practices, ETS, through the OTI, strives to safeguard the various processes involved in a test development and administration cycle. These practices are discussed in detail in the next sections.

### Test Development

During the test development process, ETS staff members consistently adhere to the following established security procedures:

- Only authorized individuals have access to test content at any step during the test development, item review, and data analysis processes.
- Test developers keep all hard-copy test content, computer disk copies, art, film, proofs, and plates in locked storage when not in use.
- ETS shreds working copies of secure content as soon as they are no longer needed during the test development process.
- Test developers take further security measures when test materials are to be shared outside of ETS; this is achieved by using registered and/or secure mail, using express delivery methods, and actively tracking records of dispatch and receipt of the materials.

### Item and Data Review

ETS enforces security measures at ARP meetings to protect the integrity of meeting materials using the following guidelines:

- Individuals who participate in the ARPs must sign a confidentiality agreement.
- Meeting materials are strictly managed before, during, and after the review meetings.
- Meeting participants are supervised at all times during the meetings.
- Use of electronic devices is prohibited in the meeting rooms.

### **Item Banking**

Once the ARP review is complete, the items are placed in the item bank. ETS then delivers the items to the CDE through the California electronic item bank. Subsequent updates to content and statistics associated with items are based on data collected from field testing and the operational use of the items. The latest version of the item is retained in the bank along with the data from every administration that has included the item.

Security of the electronic item banking system is of critical importance. The measures that ETS takes for assuring the security of electronic files include the following:

- Electronic forms of test content, documentation, and item banks are backed up electronically, with the backups kept off site, to prevent loss from a system breakdown or a natural disaster.
- The offsite backup files are kept in secure storage with access limited to authorized personnel only.
- To prevent unauthorized electronic access to the item bank, state-of-the-art network security measures are used.

ETS routinely maintains many secure electronic systems for both internal and external access. The current electronic item banking application includes a login/password system to provide authorized access to the database or designated portions of the database. In addition, only users authorized to access the specific SQL database are able to use the electronic item banking system. Designated administrators at the CDE and at ETS authorize users to access these electronic systems.

### **Transfer of Forms and Items to the CDE**

ETS shares a secure file transfer protocol (SFTP) site with the CDE. SFTP is a method for reliable and exclusive routing of files. Files reside on a password-protected server that only authorized users may access. On that site, ETS posts Microsoft Word and Excel, Adobe Acrobat PDF, or other document files for the CDE to review. ETS sends a notification e-mail to the CDE to announce that files are posted. Item data are always transmitted in an encrypted format to the SFTP site; test data are never sent via e-mail. The SFTP server is used as a conduit for the transfer of files; secure test data are not stored permanently on the shared SFTP server.

### **Security of Electronic Files Using a Firewall**

A firewall is software that prevents unauthorized entry to files, e-mail, and other organization-specific programs. ETS data exchange and internal e-mail remain within the ETS firewall at all ETS locations, ranging from Princeton, New Jersey, to San Antonio, Texas, to Concord and Sacramento, California.

All electronic applications included in the STAR Management System (CDE, 2013a) remain protected by the ETS firewall software at all times. Due to the sensitive nature of the student information processed by the STAR Management System, the firewall plays a significant role in maintaining an assurance of confidentiality in the users of this information.

## Printing and Publishing

After items and test forms are approved, the files are sent for printing on a CD using a secure courier system. According to the established procedures, the OTI preapproves all printing vendors before they can work on secured confidential and proprietary testing materials. The printing vendor must submit a completed ETS Printing Plan and a Typesetting Facility Security Plan; both plans document security procedures, access to testing materials, a log of work in progress, personnel procedures, and access to the facilities by the employees and visitors. After reviewing the completed plans, representatives of the OTI visit the printing vendor to conduct an onsite inspection. The printing vendor ships printed test booklets to Pearson and other authorized locations. Pearson distributes the booklets to school districts in securely packaged boxes.

## Test Administration

Pearson receives testing materials from printers, packages them, and sends them to school districts. After testing, the school districts return materials to Pearson for scoring. During these events, Pearson takes extraordinary measures to protect the testing materials. Pearson's customized Oracle business applications verify that inventory controls are in place, from materials receipt to packaging. The reputable carriers used by Pearson provide a specialized handling and delivery service that maintains test security and meets the STAR program schedule. The carriers provide inside delivery directly to the district STAR coordinators or authorized recipients of the assessment materials.

## Test Delivery

Test security requires accounting for all secure materials before, during, and after each test administration. The district STAR coordinators are, therefore, required to keep all testing materials in central locked storage except during actual test administration times. Test site coordinators are responsible for accounting for and returning all secure materials to the district STAR coordinator, who is responsible for returning them to the STAR Scoring and Processing Center. The following measures are in place to ensure security of STAR testing materials:

- District STAR coordinators are required to sign and submit a "STAR Test (Including Field Tests) Security Agreement for District and Test Site Coordinators" form to the STAR Technical Assistance Center before ETS can ship any testing materials to the school district.
- Test site coordinators have to sign and submit a "STAR Test (Including Field Tests) Security Agreement for District and Test Site Coordinators" form to the district STAR coordinator before any testing materials can be delivered to the school/test site.
- Anyone having access to the testing materials must sign and submit a "STAR Test (Including Field Tests) Security Affidavit for Test Examiners, Proctors, Scribes, and Any Other Person Having Access to STAR Tests" form to the test site coordinator before receiving access to any testing materials.
- It is the responsibility of each person participating in the STAR Program to report immediately any violation or suspected violation of test security or confidentiality. The test site coordinator is responsible for immediately reporting any security violation to the district STAR coordinator. The district STAR coordinator must contact the CDE immediately; the coordinator will be asked to follow up with a written explanation of the violation or suspected violation.

## Processing and Scoring

An environment that promotes the security of the test prompts, student responses, data, and employees throughout a project is of utmost concern to Pearson. Pearson requires the following standard safeguards for security at its sites:

- There is controlled access to the facility.
- No test materials may leave the facility during the project without the permission of a person or persons designated by the CDE.
- All scoring personnel must sign a nondisclosure and confidentiality form in which they agree not to use or divulge any information concerning tests, scoring guides, or individual student responses.
- All staff must wear Pearson identification badges at all times in Pearson facilities.

No recording or photographic equipment is allowed in the scoring area without the consent of the CDE.

The completed and scored answer documents are stored in secure warehouses. After they are stored, they will not be handled again unless questions arise about a student's score. For example, a school district may request that a student's test responses be rescored. In such a case, the answer document is removed from storage, copied, and sent securely to the ETS facility in Sacramento, California, for hand scoring, after which the copy is destroyed. School and district personnel are not allowed to look at a completed answer document unless required for transcription or to investigate irregular cases.

All answer documents, test booklets, and other secure testing materials are destroyed after October 31 each year.

## Data Management

Pearson provides overall security for assessment materials through its limited-access facilities and through its secure data processing capabilities. Pearson enforces stringent procedures to prevent unauthorized attempts to access its facilities. Entrances are monitored by security personnel and a computerized badge-reading system is utilized. Upon entering a facility, all Pearson employees are required to display identification badges that must be worn at all times while in the facility. Visitors must sign in and out. While they are at the facility, they are assigned a visitor badge and escorted by Pearson personnel. Access to the Data Center is further controlled by the computerized badge-reading system that allows entrance only to those employees who possess the proper authorization.

Data, electronic files, test files, programs (source and object), and all associated tables and parameters are maintained in secure network libraries for all systems developed and maintained in a client-server environment. Only authorized software development employees are given access as needed for development, testing, and implementation in a strictly controlled Configuration Management environment.

For mainframe processes, Pearson utilizes Random Access Control Facility (RACF) to limit and control access to all data files (test and production), source code, object code, databases, and tables. RACF controls who is authorized to alter, update, or even read the files. All attempts to access files on the mainframe by unauthorized users are logged and monitored. In addition, Pearson uses ChangeMan, a mainframe configuration management tool, to control versions of the software and data files. ChangeMan provides another level of security, combined with RACF, to place the correct tested version of code into production. Unapproved changes are not implemented without prior review and approval.

## Transfer of Scores via Secure Data Exchange

After scoring is completed, Pearson sends scored data files to ETS and follows secure data exchange procedures. ETS and Pearson have implemented procedures and systems to provide efficient coordination of secure data exchange. This includes the established SFTP site that is used for secure data transfers between ETS and Pearson. These well-established procedures provide timely, efficient, and secure transfer of data. Access to the STAR data files is limited to appropriate personnel with direct project responsibilities.

## Statistical Analysis

The Information Technology (IT) area at ETS retrieves the Pearson data files from the SFTP site and loads them into a database. The Data Quality Services (DQS) area at ETS extracts the data from the database and performs quality control procedures before passing files to the ETS Statistical Analysis group. The Statistical Analysis group keeps the files on secure servers and adheres to the ETS Code of Ethics and the ETS Information Protection Policies to prevent any unauthorized access.

## Reporting and Posting Results

After statistical analysis has been completed on student data, the following deliverables are produced:

- Paper reports, some with individual student results and others with summary results
- A file of individual student results—available for download through the QTR module of the STAR Management System—that shows students' scale scores and performance levels
- Encrypted files of summary results (sent to the CDE by means of SFTP) (Any summary results that have fewer than 11 students are not reported.)
- Item-level statistics based on the results which are entered into the item bank

## Student Confidentiality

To meet ESEA and state requirements, school districts must collect demographic data about students. This includes information about students' ethnicity, parent education, disabilities, whether the student qualifies for the National School Lunch Program (NSLP), and so forth (CDE, 2013b). In addition, students may reveal other information about themselves through the essays they write. ETS takes precautions to prevent any of this information from becoming public or being used for anything other than testing purposes. These procedures are applied to all documents in which these student demographic data may appear, including the following:

- Pre-ID files
- Reports
- Essays

## Student Test Results

ETS also has security measures for files and reports that show students' scores and performance levels. ETS is committed to safeguarding the information in its possession from unauthorized access, disclosure, modification, or destruction. ETS has strict information security policies in place to protect the confidentiality of ETS and client data. ETS staff access to production databases is limited to personnel with a business need to access the data. User IDs for production systems must be person-specific or for systems use only.

ETS has implemented network controls for routers, gateways, switches, firewalls, network tier management, and network connectivity. Routers, gateways, and switches represent points of access between networks. However, these do not contain mass storage or represent points of vulnerability, particularly to unauthorized access or denial of service. Routers, switches, firewalls, and gateways may possess little in the way of logical access.

ETS has many facilities and procedures that protect computer files. Facilities, policies, software, and procedures such as firewalls, intrusion detection, and virus control are in place to provide for physical security, data security, and disaster recovery. ETS is certified in the BS 25999-2 standard for business continuity and conducts disaster recovery exercises annually. ETS routinely backs up its data to either disk through deduplication or to tape, both of which are stored off site.

Access to the ETS Computer Processing Center is controlled by employee and visitor identification badges. The Center is secured by doors that can only be unlocked by the badges of personnel who have functional responsibilities within its secure perimeter. Authorized personnel accompany visitors to the Data Center at all times. Extensive smoke detection and alarm systems, as well as a pre-action fire-control system, are installed in the Center.

ETS protects individual students' results on both electronic files and paper reports during the following events:

- Scoring
- Transfer of scores by means of secure data exchange
- Reporting
- Analysis and reporting of erasure marks
- Posting of aggregate data
- Storage

In addition to protecting the confidentiality of testing materials, ETS's Code of Ethics further prohibits ETS employees from financial misuse, conflicts of interest, and unauthorized appropriation of ETS's property and resources. Specific rules are also given to ETS employees and their immediate families who may take a test developed by ETS, such as a STAR examination. The ETS Office of Testing Integrity verifies that these standards are followed throughout ETS. It does this, in part, by conducting periodic onsite security audits of departments, with follow-up reports containing recommendations for improvement.

## **Procedures to Maintain Standardization**

The CMA processes are designed so that the tests are administered and scored in a standardized manner. ETS employs personnel who facilitate various processes involved in the standardization of an administration cycle and takes all necessary measures to ensure the standardization of the CMA, as described in this section.

### **Test Administrators**

The CMA are administered in conjunction with the other tests that comprise the STAR Program. The responsibilities for district and test site staff members are included in the *STAR District and Test Site Coordinator Manual* (CDE, 2013c). This manual is described in the next section.

The staff members centrally involved in the test administration are as follows:

### **District STAR Coordinator**

Each local educational agency (LEA) designates a district STAR coordinator who is responsible for ensuring the proper and consistent administration of the STAR tests. LEAs include public school districts, statewide benefit charter schools, state board-authorized charter schools, county office of education programs, and charter schools testing independently from their home district.

District STAR coordinators are also responsible for securing testing materials upon receipt, distributing testing materials to schools, tracking the materials, training and answering questions from district staff and test site coordinators, reporting any testing irregularities or security breaches to the CDE, receiving scorable and nonscorable materials from schools after an administration, and returning the materials to the STAR contractor for processing.

### **Test Site Coordinator**

The superintendent of the school district or the district STAR coordinator designates a STAR test site coordinator at each test site from among the employees of the school district. (5 CCR Section 858 [a])

Test site coordinators are responsible for making sure that the school has the proper testing materials, distributing testing materials within a school, securing materials before, during, and after the administration period, answering questions from test examiners, preparing and packaging materials to be returned to the school district after testing, and returning the materials to the school district. (CDE, 2013c)

### **Test Examiner**

The CMA are administered by test examiners who may be assisted by test proctors and scribes. A test examiner is an employee of a school district or an employee of a nonpublic, nonsectarian school (NPS) who has been trained to administer the tests and has signed a STAR Test Security Affidavit. Test examiners must follow the directions in the *California Modified Assessment Directions for Administration (DFA)* (CDE, 2013d) exactly.

### **Test Proctor**

A test proctor is an employee of the school district or a person, assigned by an NPS to implement the IEP of a student, who has received training designed to prepare the proctor to assist the test examiner in the administration of tests within the STAR Program (5 CCR Section 850 [r]). Test proctors must sign STAR Test Security Affidavits (5 CCR Section 859 [c]).

### **Scribe**

A scribe is an employee of the school district or a person, assigned by an NPS to implement the IEP of a student, who is required to transcribe a student's responses to the format required by the test. A student's parent or guardian is not eligible to serve as the student's scribe (5 CCR Section 850 [m]). Scribes must sign STAR Test Security Affidavits (5 CCR Section 859 [c]).

### **Directions for Administration**

CMA DFAs are manuals used by test examiners to administer the CMA to students (CDE, 2013d). Test examiners must follow all directions and guidelines and read, word-for-word, the instructions to students in "SAY" boxes to ensure test standardization.

### **District and Test Site Coordinator Manual**

Test administration procedures are to be followed exactly so that all students have an equal opportunity to demonstrate their academic achievement. The *STAR District and Test Site*

*Coordinator Manual* contributes to this goal by providing information about the responsibilities of district and test site coordinators, as well as those of the other staff involved in the administration cycle (CDE, 2013c). However, the manual is not intended as a substitute for the *CCR, Title 5, Education (5 CCR)*, or to detail all of the coordinator's responsibilities.

## STAR Management System Manuals

The STAR Management System is a series of secure, Web-based modules that allow district STAR coordinators to set up test administrations, order materials, and submit and correct student Pre-ID data. Every module has its own user manual with detailed instructions on how to use the STAR Management System. The modules of the STAR Management System are as follows:

- **Test Administration Setup**—This module allows school districts to determine and calculate dates for scheduling test administrations for school districts, to verify contact information for those school districts, and to update the school district's shipping information. (CDE, 2013e)
- **Order Management**—This module allows school districts to enter quantities of testing materials for schools. Its manual includes guidelines for determining which materials to order. (CDE, 2013f)
- **Pre-ID**—This module allows school districts to enter or upload student information, including demographics, and identify the test(s) the student will take. This information is printed on student test booklets or answer documents or on labels that can be affixed to test booklets or answer documents. Its manual includes the CDE's Pre-ID layout. (CDE, 2013b)
- **Extended Pre-ID Data Corrections**—This module allows school districts to correct the data that were submitted during Pre-ID prior to the last day of the school district's selected testing window. (CDE, 2013b)

## Test Booklets

For each grade-level and end-of-course test, multiple versions of test booklets are administered. The versions differ only in terms of the field-test items they contain. In grades three through eleven, these versions are spiraled—comingled—and packaged consecutively and are distributed at the student level; that is, each classroom or group of test-takers receives at least one of each version of the test.

The test booklets, along with answer documents and other supporting materials, are packaged by school or group, depending on how the district STAR coordinator ordered the materials. All materials are sent to the district STAR coordinator for proper distribution within the LEA. Special formats of test booklets are also available for test-takers who require accommodations to participate in testing. These special formats include large-print and braille testing materials.

## Test Variations and Accommodations

All public school students participate in the STAR Program, including students with disabilities and English learners. ETS policy states that reasonable testing accommodations be provided to candidates with documented disabilities that are identified in the Americans with Disabilities Act (ADA). The ADA mandates that test accommodations be individualized, meaning that no single type of test accommodation may be adequate or appropriate for all individuals with any given type of disability. The ADA authorizes that test-takers with

disabilities may be tested under standard conditions if ETS determines that only minor adjustments to the testing environment are required (e.g., wheelchair access, large-print test book, a sign language interpreter for spoken directions).

## Identification

Most students with disabilities and most English learners take the CMA under standard conditions. However, some students with disabilities and some English learners may need assistance when taking the CMA. This assistance takes the form of test variations or accommodations (see Appendix 2.D on page 27 in Chapter 2 for details). During the test, these students may use the special services specified in their IEP or Section 504 plan. If students use accommodations for the CMA, test examiners are responsible for marking the accommodation(s) used on the students' test booklets, answer documents, or Writing Response Booklets. Because the CMA were developed with modifications built into the test, modifications are not allowed. Students who require additional modifications take the content-area CST with modifications.

In the event that a student injures a hand or arm prior to the writing test, is willing and able to sit for the examination, but unable to write, the school completes a Section 504 plan for the student. The Section 504 plan identifies which accommodations the student will use in completion of his or her writing test (CDE, 2013c).

## Scoring

The purpose of test variations and accommodations is to enable students to take the CMA, not to give them an advantage over other students or to inflate their scores artificially. Test administration variations and accommodations do not result in changes to students' scores for API or AYP calculations. The addition of CMA results into the API does not change the API test weights; the same test weights and calculation rules used for the CSTs also apply to the CMA.

## Demographic Data Corrections

After reviewing student data, some school districts may discover assessment-related data—such as special conditions, accommodations, variations, test taken, and so forth—that are incorrect. The Demographic Data Corrections module of the STAR Management System gives school districts the means to correct these data within a specified availability window. Districts may correct data to: (1) Have the school district's API/AYP recalculated (when changes are merged with demographic data corrections entered into the California Longitudinal Pupil Assessment Data System); (2) Rescore uncoded or miscoded CMA end-of-course mathematics tests; (3) Obtain a corrected data CD-ROM for school district records; or (4) Match unmatched records for grades four and seven writing and multiple-choice tests. (CDE, 2013g)

## Testing Irregularities

Testing irregularities are circumstances that may compromise the reliability and validity of test results and, if more than five percent of the students tested are involved, could affect a school's API and AYP.

The district STAR coordinator is responsible for immediately notifying the CDE of any irregularities that occur before, during, or after testing. The test examiner is responsible for immediately notifying the district STAR coordinator of any security breaches or testing irregularities that occur in the administration of the test. Once the district STAR coordinator and the CDE have determined that an irregularity has occurred, the CDE instructs the

district STAR coordinator on how and where to identify the irregularity on the student test booklet or answer document. The information and procedures to assist in identifying irregularities and notifying the CDE are provided in the *STAR District and Test Site Coordinator Manual* (CDE, 2013c).

### **Social Media Security Breaches**

Social media security breaches are exposures of test questions and testing materials through social media Web sites. These security breaches raise serious concerns that require comprehensive investigation and additional statistical analyses. In recognizing the importance of and the need to provide valid and reliable results to the state, districts, and schools, both the CDE and ETS take every precaution necessary, including extensive statistical analyses, to ensure that all test results maintain the highest levels of psychometric integrity.

A preliminary investigation into the scope and magnitude of 2013 social media security breaches was completed by the end of May and resulted in a list of exposed test questions (items) that were found on social media Web sites.

After the list of exposed items was obtained, ETS identified whether any of those items were operational (and, therefore, contributed to test scores) and conducted statistical analyses to determine whether any test items affected by the security breach needed to be removed from scoring to maintain the validity of test results. Because the CMA comprise previously administered forms and are pre-equated, were any items removed from scoring due to exposure, scoring keys and conversion tables for the affected test(s) would be revised and all the students who had taken those tests rescored.

An exhaustive review of the spring 2013 statistical results did not provide evidence of performance differences between exposed and nonexposed items. From a statistical perspective, results did not indicate the need to remove exposed items from scoring. ETS, therefore, recommended that all exposed items be included in scoring for the 2013 administration.

### **Test Administration Incidents**

A test administration incident is any event that occurs before, during, or after test administrations that does not conform to the instructions stated in the *DFAs* (CDE, 2013d) and the *STAR District and Test Site Coordinator Manual* (CDE, 2013c). These events include test administration errors, disruptions, and student cheating. Test administration incidents generally do not affect test results. These administration incidents are not reported to the CDE or the STAR Program testing contractor. The STAR test site coordinator should immediately notify the district STAR coordinator of any test administration incidents that occur. It is recommended by the CDE that districts and schools maintain records of these incidents.

## Chapter 6: Performance Standards

---

### Background

The CMA were introduced in stages, starting with the lower grades in 2008. Performance standards for each new test were developed after the introductory year for operational use in subsequent administrations. The CMA for ELA and mathematics in grades three through five and science in grade five became part of the STAR Program in spring 2008. For each test, the performance standards were developed in September and October 2008 and adopted by the SBE for the 2009 operational administration of those tests.

In spring 2009, the CMA for ELA in grades six through eight, mathematics in grades six and seven, and science in grade eight were introduced. The performance standards for those tests were developed in August 2009 and adopted by the SBE for the 2010 operational administration of those CMA.

The CMA for high school phase 1 (ELA in grade nine, Life Science in grade ten, and EOC Algebra I) were introduced in spring 2010. The performance standards for those tests were developed in August 2010 and adopted by the SBE for use starting in the 2011 operational administration.

Finally, the CMA for high school phase 2 (ELA in grades ten and eleven and EOC Geometry) were introduced in spring 2011. The performance standards for these tests were established in fall 2011 and adopted by the SBE for use starting in the 2012 operational administration.

The performance standards for the CMA were defined by the SBE as far below basic, below basic, basic, proficient, and advanced. Performance standards are developed from a general description of the performance level (policy-level descriptors) and competencies lists, which operationally define each level. Cut scores numerically define the performance levels.

The state target is to have all students achieve the proficient or advanced level by 2014. Schools and districts are expected to provide additional assistance to students scoring at or below the basic level.

California employed carefully designed standard-setting procedures to facilitate the development of performance standards for each CMA. The standard-setting method used for the CMA is the Bookmark method. These processes are described in the sections that follow.

### Standard-Setting Procedure

The process of standard setting is designed to identify a “cut score” or minimum test score that is required to qualify a student for each performance level. The process generally requires that a panel of subject-matter experts and others with relevant perspectives (for example, teachers, school administrators) be assembled. The panelists for the CMA standard setting were selected based on the following characteristics:

- Familiarity with the subject matter assessed
- Familiarity with students in the respective grade levels
- Experience with English learners

- Experience in special education and general education classrooms as well as integrated classrooms
- Familiarity with the California content standards
- An understanding of the CMA
- An appreciation of the consequences of setting these cut scores

Panelists were recruited from diverse geographic regions and from different gender and major racial/ethnic subgroups to be representative of the educators of the state's CMA-eligible students (ETS, 2009a, 2009b, 2010, 2011).

For each test, three cut scores were developed in order to differentiate four of the five performance levels: below basic, basic, proficient, and advanced. Far below basic was defined as chance-level performance.

The standard-setting processes implemented for the CMA required panelists to follow these steps, which include training and practice prior to making judgments:

1. Prior to attending the workshop, all panelists received a pre-workshop assignment. The task was to review, on their own, the content standards upon which the test items are based and take notes on their own expectations in the content area. This allowed the panelists to understand how their perceptions may relate to the complexity of the content standards.
2. At the start of the workshop, panelists received training, which included the purpose of standard setting and their role in the work, the meaning of a "cut score" and "impact data," and specific training and practice in the Bookmark method. Impact data included the percentage of examinees assessed in a previous administration of the test that would fall into each level, given the panelists' judgments of cut scores.
3. Panelists became familiar with the difficulty level of the items by taking the actual test and then assessing and discussing the demands of the test items.
4. Panelists reviewed the draft list of competencies as a group, noting the increasing demands of each subsequent level. In this step, they began to visualize the knowledge and skills of students in each performance level.
5. Panelists identified characteristics of a "borderline" test-taker or "target student." This student is defined as one who possesses just enough knowledge of the content to move over the border separating a performance level from the performance level below it.
6. After training in the method was complete and confirmed through an evaluation questionnaire, panelists made individual judgments. Working in small groups, they discussed feedback related to other panelists' judgments and feedback based on student performance data (impact data). Panelists could revise their judgments during the process if they wished.
7. The final recommended cut scores were based on the median of panelists' judgment scores at the end of three rounds (in the Bookmark method, the panel recommendation is calculated by taking the median of the small group [table] medians). For the CMA, the cut scores recommended by the panelists and the recommendation of the State Superintendent of Public Instruction were presented for public comment at regional public hearings. Comments and recommendations were then presented to the SBE for adoption.

## Development of Competencies Lists

Prior to the CMA standard-setting workshop, ETS facilitated a meeting in which a subset of the standard-setting panelists was assembled to develop lists of competencies based on the California content standards and policy-level descriptors. For each content area, one panel of educators was assembled for each grade to identify and discuss the competencies required of students taking the CMA for each performance level (below basic, basic, proficient, and advanced). The lists were used to facilitate the discussion and construction of the target student definitions during the standard-setting workshop.

## Standard-Setting Methodology

### Bookmark Method

The Bookmark method for setting cut scores was introduced in 1999 and has been used widely across the United States (Lewis, et al., 1999; Mitzel, et al., 2001). In California, the Bookmark method has been used in standard settings for most of the STAR tests.

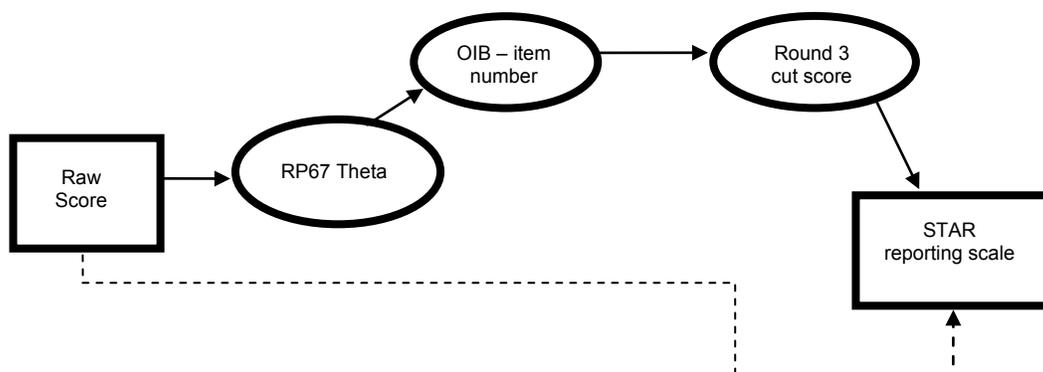

The Bookmark method is an item-mapping procedure in which panelists consider content covered by items in a specially constructed book where items are ordered from easiest to hardest based on operational student performance data from a previous test administration. The “item map,” which accompanies the ordered item booklet (OIB), includes information on the content measured by each operational test question, information about each question’s difficulty, the correct answer for each question, and where each question was located in the test booklet before the questions were reordered by difficulty.

Panelists are asked to place a bookmark in the OIB to demarcate each performance level. The bookmarks are placed with the assumption that the borderline students will perform successfully at a given performance level with a probability of at least 0.67. Conversely, these students are expected to perform successfully on the items after the bookmark with a probability of less than 0.67 (Huynh, 1998).

In this method, the panelists’ cut-score recommendations are presented in the metric of the OIB and are derived by obtaining the median of the corresponding bookmarks placed for each performance level across panelists.

Each item location corresponds to a value of theta, based on a response probability of 0.67 (RP67 Theta), which maps back to a raw score on this test form. Figure 6.1 below may best illustrate the relationship among the various metrics used when the Bookmark method is applied. The solid lines represent steps in the standard-setting process described above; the dotted line represents the scaling described in the next section.

**Figure 6.1 Bookmark Standard Setting Process for the CMA**

## Results

The cut scores obtained as a result of the standard-setting process are on the IRT scale; each recommended cut score is associated with a theta value in the OIB. This RP67 Theta has a corresponding number-correct or raw score for the test form upon which standards were set; the scores are then translated to a score scale that ranges between 150 and 600. The cut score for the basic performance level is 300 for every grade and content area; this means that a student must earn a score of 300 or higher to achieve a basic classification. The cut score for the proficient performance level is 350 for every grade and content area; this means that a student must earn a score of 350 or higher to achieve a proficient classification.

The cut scores for the other performance levels are derived using procedures based on IRT and usually vary by grade and content area. Each raw cut score for a given test is mapped to an IRT *theta* ( $\theta$ ) using the test characteristic function or curve and then transformed to the scale-score metric using the following equation:

$$\text{Scale Cut Score} = (350 - \theta_{\text{proficient}} \times \left( \frac{350 - 300}{\theta_{\text{proficient}} - \theta_{\text{basic}}} \right)) + \left( \frac{350 - 300}{\theta_{\text{proficient}} - \theta_{\text{basic}}} \right) \times \theta_{\text{cut-score}} \quad (6.1)$$

where,

$\theta_{\text{cut-score}}$  represents the student ability at cut scores for performance levels other than proficient or basic, e.g., below basic or advanced,

$\theta_{\text{proficient}}$  represents the theta corresponding to the cut score for proficient, and

$\theta_{\text{basic}}$  represents the theta corresponding to the cut score for basic.

Please note that an IRT test characteristic function or curve is the sum of item characteristic curves (ICC), where an ICC represents the probability of correctly responding to an item conditioned on examinee ability.

The scale-score ranges for each performance level are presented in Table 2.1 on page 17. The cut score for each performance level is the lower bound of each scale-score range. The scale-score ranges do not change from year to year. Once established, they remain unchanged from administration to administration until such time that new performance levels are adopted.

Table 7.2 on page 121 in Chapter 7 presents the percentages of examinees meeting each performance level in 2013.

## Chapter 7: Scoring and Reporting

---

ETS conforms to high standards of quality and fairness (ETS, 2002) when scoring tests and reporting scores. These standards dictate that ETS provides accurate and understandable assessment results to the intended recipients. It is also ETS's mission to provide appropriate guidelines for score interpretation and cautions about the limitations in the meaning and use of the test scores. Finally, ETS conducts analyses needed to ensure that the assessments are equitable for various groups of test-takers.

### Procedures for Maintaining and Retrieving Individual Scores

Items for all the CMA, except for the writing task in grades four and seven, are multiple choice. Students are presented with a question and asked to select the correct answer from among three possible choices. In grade three, students mark their answer choices in the test booklet. In the other grades, students mark their answer choices in an answer document. All multiple-choice questions are machine scored. Responses to the writing task are scored by trained raters.

In the 2013 administration, because the raw-score-to-scale-score conversion tables were developed before tests were administered using pre-equating, individual student results were available within approximately ten days of processing the school district's scorable testing materials through the Quick-turnaround Reporting (QTR) module in the STAR Management System.

In order to score and report CMA results, ETS follows an established set of written procedures. The specifications for these procedures are presented in the next sections.

### Scoring and Reporting Specifications

ETS develops standardized scoring procedures and specifications so that test materials are processed and scored accurately. These documents include the following:

- General Reporting Specifications—Provides the calculation rules for the information presented on STAR summary reports and defines the appropriate codes to use when a student does not take or complete a test or when a score will not be reported
- Score Key and Score Conversion—Defines file formats and information that is provided for scoring and the process of converting raw scores to scale scores
- Form Planner Specifications—Describes, in detail, the contents of files that contain keys required for scoring
- Aggregation Rules—Describes how and when a school's results are aggregated at the school, district, county, and state levels
- "What If" List—Provides a variety of anomalous scenarios that may occur when test materials are returned by school districts to Pearson and defines the action(s) to be taken in response
- Edit Specifications—Describes edits, defaults, and solutions to errors encountered while data are being captured as answer documents are processed
- Reporting Cluster Names and Item Numbers—Identifies the reporting clusters for each test and the number of items in each cluster
- CST and CMA Matching Criteria—Describes the criteria necessary to ensure that, for students who take both CST and CMA tests, all results are combined into a single

student data record by matching specific demographic fields on test booklets and answer documents

- **Matching Criteria for Multiple-choice and Writing Answer Documents**—Describes the method used to match students' writing and multiple-choice responses

The scoring specifications are reviewed and revised by the CDE, ETS, and Pearson each year. After a version agreeable to all parties is finalized, the CDE issues a formal approval of the scoring and reporting specifications.

## **Scanning and Scoring**

Answer documents are scanned and scored by Pearson in accordance with the scoring specifications that have been approved by the CDE. Answer documents are designed to produce a single complete record for each student. This record includes demographic data and scanned responses for each student; once computed, the scored responses and the total test scores for a student are also merged into the same record. All scores, including those available in quick-turnaround reporting, must comply with the ETS scoring specifications. Pearson has quality control checks in place to ensure the quality and accuracy of scanning and the transfer of scores into the database of student records.

Each school district must return scorable and nonscorable materials within five working days after the selected last day of testing for each test administration period. For the CMA for Writing test materials, school districts return the writing booklets within two working days after the test administration's makeup day.

## **Types of Scores and Subscores**

### **Raw Score**

For all of the tests, the total test raw score equals the number of multiple-choice test items answered correctly.

### **Subscore**

The items in each CMA are aggregated into groups of related content standards to form reporting clusters. A subscore is a measure of an examinee's performance on the items in each reporting cluster. These results are reported both as raw scores and percent of items answered correctly. A description of the CMA reporting clusters is provided in Appendix 2.B of Chapter 2, starting on page 21.

### **Scale Score**

Raw scores obtained on each CMA are transformed to three-digit scale scores using the equating process described in Chapter 2 on page 14. Scale scores range from 150 to 600 on each CMA. The scale scores of examinees that have been tested in different years at a given grade level and content area can be compared. However, the raw scores of these examinees cannot be meaningfully compared, because these scores are affected by the relative difficulty of the test taken as well as the ability of the examinee.

### **Performance Levels**

The performance of each student on each CMA is categorized into one of the following performance levels:

- far below basic
- below basic
- basic

- proficient
- advanced

For all CMA, the cut score for the basic performance level is 300 for every grade and content area; this means that a student must earn a score of 300 or higher to achieve a basic classification. The cut score for the proficient performance level is 350 for every grade and content area; this means that a student must earn a score of 350 or higher to achieve a proficient classification. The cut scores for the other performance levels usually vary by grade and content area.

### **Writing Response Score**

Examinees' essay responses to the writing task associated with the grades four and seven CMA for ELA are rated on a 0–4 scale by a single reader. A score of zero indicates that the student attempted the writing task but either did not provide a response, refused to provide a response, or responded to a writing task from an earlier administration. The rubrics used to assign the nonzero scores to the writing tasks for grades four and seven are presented in Appendix 7.A, which starts on page 128.

It is important to note that the writing score, considered in isolation, does not correspond directly to one of the five performance levels used to show overall student performance on the CMA for ELA tests, nor is it included in the CMA for ELA total score. For example, a writing score of 4 does not correspond to the advanced performance level, nor does a writing score of 3 correspond to the proficient performance level.

It should be noted that parents/guardians may choose not to let their child attempt the writing task in grade four or seven. In these cases, the student will not receive a writing score.

In 2013, the writing score was separated from the total ELA score to allow for early ELA student results to be reported via QTR.

## **Score Verification Procedures**

Various necessary measures are taken to ascertain that the scoring keys are applied to the student responses as intended and that the student scores are computed accurately. In 2013, every regular and special-version multiple-choice test is certified by ETS prior to being included in quick-turnaround reporting. To certify a test, psychometricians gather a certain number of test cases and verify the accurate application of scoring keys and scoring tables.

### **Scoring Key Verification Process**

Scoring keys, provided in the form planners, are produced by ETS and verified by performing multiple quality-control checks. The form planners contain the information about an assembled test form, including scoring keys, test name, administration year, subscore identification, and the standards and statistics associated with each item. The quality control checks that are performed before keys are finalized are listed below:

1. Keys in the form planners are checked against their matching test booklets to ensure that the correct keys are listed.
2. The form planners are checked for accuracy against the Form Planner Specification document and the Score Key and Score Conversion document before the keys are loaded into the score key management system (SKM) at ETS.
3. The printed lists of the scoring keys are checked again once the keys have been loaded into the SKM system.

4. The demarcations of various sections in the actual test booklets are checked against the list of demarcations provided by ETS test development staff.
5. Scoring is verified internally at Pearson. ETS independently generates scores and verifies Pearson's scoring of the data by comparing the two results. Any discrepancies are then resolved.
6. The entire scoring system is tested using a test deck that includes typical and extremely atypical response vectors.
7. Classical item analyses are computed on an early sample of data to provide an additional check of the keys. Although rare, if an item is found to be problematic, a follow-up process is carried out for it to be excluded from further analyses.

## Monitoring and Quality Control of Writing Scoring

Students who take the CMA for ELA in grades four and seven respond to one of two writing tasks each year. One task is administered to the majority of test-takers; the other is administered to students in schools, tracks, or programs not in session during the first administration.

Students' responses to the writing task are each read by a single reader; the writing score is based on that reader's rating. In addition, 10 percent of students' responses are also read by a second reader to provide data that can be used to assess the accuracy and reliability of the writing scores. The score from the second reader does not count toward the student's writing test score.

The next sections detail the process employed by Pearson to score the writing tasks.

### Scoring System

All student responses are scanned into the Electronic Performance Evaluation Network (ePEN™) system. Scorers view assigned responses on a computer at one of Pearson's regional scoring centers. The screen does *not* display the student's name or background information; the scorer sees only the student response.

### Scorer Training

Individuals who are selected to serve as scorers must be college graduates who possess at least a Bachelor of Arts degree. Each prospective scorer is required to participate in extensive computer-based training and is provided with the following kinds of information:

- General information about the ePEN™ system
- Background information about the STAR Program
- Information about the STAR writing tasks
- Explanations of STAR scoring rubrics and scoring principles
- Sets of prescored annotated training papers
  - The training papers include anchor and practice papers.
  - Anchor papers provide samples of student writing that represent each of the four points in the scoring rubric. The samples of student responses are identified at the rangefinding sessions. During these sessions, the content experts at Pearson select sample responses that represent each of the four score points and illustrate the different ways of responding to the topic.
  - Practice papers include samples of student writing that demonstrate the “high” and “low” end of each score point.

### **Scorer Qualification**

Once the training is complete, the potential scorers complete the Qualification Sets (three sets of scored papers consisting of ten papers per set) before being eligible to score. On at least two of the three sets, scorers must demonstrate exact agreement or adjacent agreement with the scores assigned to seventy percent of the papers on each of these sets.

Scorers continue to qualify throughout the scoring process. Before each operational scoring session, each scorer scores a Calibration Set of three to four papers. The scores on these sets have been previously agreed upon by scoring directors in conjunction with other personnel. The sets are given to scorers to ensure that the accuracy of their scoring does not drift. These sets are used to calibrate the scorers. The scorers that cannot be calibrated during this process do not qualify for operational scoring.

### **Scoring Supervisors and Directors**

Scoring supervisors monitor and mentor scorers during operational scoring. If a writing response is difficult to score, the scorers elevate the response to the scoring supervisor to be scored. In these cases, the scoring supervisor's score is the final writing score.

Scorers with a history of achieving the highest accuracy on the Qualification Sets and the highest level of scoring consistency and validity statistics during operational scoring are selected as scoring supervisors. Approximately ten scorers are assigned to one scoring supervisor; this ratio allows scoring supervisors to work closely with each scorer. The ePEN™ system also allows scoring supervisors to continuously monitor each response scored and the score point assigned to ensure accuracy. All scoring supervisors participate in a two-day training session that provides the same training that is used to qualify scorers. If a scoring supervisor does not achieve the accuracy required on the Qualification Sets, that individual is not allowed to be a supervisor. In addition, all supervisors receive extensive training on how the ePEN™ system works, how to best manage scorers, and how to maintain accuracy as scoring continues.

Scoring directors are responsible for overseeing the scoring and providing leadership for the scoring supervisors. They also help to manage the scorers, and they are ultimately responsible for maintaining the highest accuracy possible during STAR scoring. Scoring directors represent the best of the scoring supervisors. They typically have two to three years of experience as scoring supervisors and strong leadership qualities, as well as a thorough understanding of STAR scoring.

### **Accuracy Monitoring**

The accuracy of all scoring is regularly monitored using several procedures: First, scoring supervisors and scoring directors constantly monitor the degree to which readers are consistent in scores that they assign. This is done using data provided by the second readers employed to score 10 percent of all student responses a second time. The consistency is measured in terms of the percentage of instances in which the first and second readers' scores are identical, adjacent, and nonadjacent; this is a commonly used measure of interrater reliability. If a scorer's rate of agreement begins to decline, the scorer is retrained by a scoring supervisor or scoring director and closely monitored thereafter. If the scorer's performance does not improve, the scorer is released.

Second, the consistency between readers' scores and those of scoring directors or supervisors is evaluated using student responses that are known as validity papers, because they have been previously scored by scoring directors or supervisors. Validity papers are ones with known psychometric properties that are intended to exemplify certain

aspects of student responses and the scores that should be assigned. One in every 40 papers read by each scorer is a validity paper. The consistency of the scorer's ratings with the scores on the validity papers is checked throughout the day to ensure that each scorer has applied the scoring rubrics accurately. The validity papers are introduced throughout the scoring process. If a scorer's performance on the validity papers falls below required levels, the scorer is retrained by a scoring supervisor or scoring director. If a scorer's ratings continue to show poor validity, the scorer is excused.

Third, scoring supervisors "back-read" a certain percentage of the student responses that have been scored by each scorer. The scorer's and supervisor's scores are then compared to check the scorer's reliability and to ensure that the scorer is maintaining scoring standards. In addition, ePEN™ allows scoring directors to view the back-reading completed by scoring supervisors to ensure that scoring supervisors are maintaining accuracy. Scoring directors also back-read to assess scorers' work.

Fourth, to minimize score drift, scorers are required to score a Calibration Set before each scoring session. If a scorer is deficient on any of the accuracy indices, that scorer is immediately retrained or released from the scoring process.

### **Score Verification Process**

ETS psychometricians employ special procedures that adjust for differences in item difficulty from one test form to another. (See Chapter 2, Pre-equating, on page 14 for details.) As a result of this process, scoring tables are produced. Such tables map the current year's raw score to an appropriate scale score. A series of quality control (QC) checks is carried out by ETS psychometricians to ensure the accuracy of each scoring table, as discussed in Chapter 9 on page 296.

Pearson utilizes the scoring tables to generate scale scores for each student. ETS verifies Pearson's scale scores by conducting QC and reasonableness checks, which are described in Chapter 9 on page 297.

## **Overview of Score Aggregation Procedures**

In order to provide meaningful results to the stakeholders, CMA scores for a given grade and content area are aggregated at the school, independently testing charter school, district, county, and state levels. The aggregated scores are generated both for individual scores and group scores. The next section contains a description of types of aggregation performed on CMA scores.

### **Individual Scores**

The tables in this section provide state-level summary statistics describing student performance on each CMA.

#### **Score Distributions and Summary Statistics**

Summary statistics that describe student performance on each CMA are presented in Table 7.1. Included in the table are the number of items in each test, the number of examinees taking each test, and the means and standard deviations of student scores expressed in terms of both raw scores and scale scores. The last two columns in the table list the raw score means and standard deviations as percentages of the total raw score points in each test.

The last content-area section in the table presents information on the grade-specific end-of-course testing groups. The statistics for grade-specific end-of-course testing groups are

based on the population of test-takers in a particular grade for which the course is recommended. While the assessments are presented to students at a variety of grade levels, the majority of test-takers belong to that specific grade.

**Table 7.1 Mean and Standard Deviation of Raw and Scale Scores for the CMA**

Content Area	CMA *	No. of Items	No. of Examinees	Scale Score		Raw Score		Raw Score Percent Correct	
				Mean	Std. Dev.	Mean	Std. Dev.	Mean	Std. Dev.
English– Language Arts	3	48	19,966	308	64	28.07	8.46	58.47	17.63
	4	48	28,630	323	71	26.55	7.77	55.31	16.19
	5	48	29,852	328	70	28.00	7.90	58.33	16.46
	6	54	29,891	308	87	30.76	8.17	56.96	15.13
	7	54	28,364	314	84	32.73	9.02	60.60	16.71
	8	54	26,593	316	76	31.08	8.34	57.55	15.45
	9	60	21,731	295	73	31.58	9.26	52.64	15.43
	10	60	18,952	293	66	30.56	8.71	50.94	14.52
	11	60	16,343	281	56	27.36	7.53	45.60	12.55
Mathematics	3	48	17,267	322	69	29.97	8.83	62.44	18.39
	4	48	24,228	326	77	27.28	6.93	56.83	14.43
	5	48	26,565	341	76	29.35	8.09	61.14	16.85
	6	54	27,348	319	81	28.86	7.49	53.44	13.87
	7	54	27,142	298	85	25.04	6.47	46.38	11.99
	Algebra I	60	31,124	290	55	29.26	8.22	48.76	13.70
	Geometry	60	8,247	288	47	28.71	7.96	47.86	13.26
Science	5	48	27,709	345	56	29.43	7.20	61.30	14.99
	8	54	24,251	336	69	31.62	8.37	58.55	15.50
	10 Life Science	60	15,629	303	62	32.03	9.28	53.39	15.47
Grade- Specific	Algebra I – 8	60	6,035	295	58	29.93	8.58	49.89	14.30
	Geometry – 9	60	628	295	57	29.68	9.15	49.46	15.25

\* Numbers indicate grade-level tests.

The percentages of students in each performance level are presented in Table 7.2. The last column of the table presents the overall percentage of examinees that were classified at the proficient level or higher.

The numbers in the summary tables may not match exactly the results reported on the CDE’s Web site because of slight differences in the samples used to compute the statistics. The P2 data file was used for the analyses in this chapter. This file contained the entire test-taking population and all the student records used in the August 8, 2013, reporting of STAR results.

**Table 7.2 Percentages of Examinees in Each Performance Level**

Content Area	CMA *	Far					Proficient/ Advanced †
		Below Basic	Below Basic	Basic	Proficient	Advanced	
English– Language Arts	3	10%	38%	26%	17%	10%	27%
	4	10%	34%	24%	20%	12%	32%
	5	4%	32%	29%	19%	17%	35%
	6	18%	29%	21%	15%	16%	31%
	7	16%	28%	22%	22%	12%	34%
	8	14%	30%	24%	20%	12%	32%
	9	26%	32%	21%	14%	7%	21%
	10	24%	33%	23%	14%	6%	20%
	11	29%	37%	22%	10%	3%	13%

Content Area	CMA *	Performance Level					Proficient/ Advanced †
		Far Below Basic	Below Basic	Basic	Proficient	Advanced	
Mathematics	3	7%	33%	24%	28%	7%	35%
	4	8%	28%	26%	28%	10%	38%
	5	4%	26%	27%	29%	14%	43%
	6	14%	31%	23%	23%	9%	32%
	7	26%	30%	20%	19%	5%	24%
	Algebra I	22%	38%	25%	11%	3%	14%
	Geometry	23%	40%	26%	9%	2%	11%
Science	5	3%	20%	31%	33%	14%	47%
	8	16%	18%	24%	26%	16%	42%
	10 Life Science	21%	29%	27%	17%	6%	23%
Grade-Specific	Algebra I – 8	20%	37%	25%	13%	4%	17%
	Geometry –9	24%	37%	22%	13%	4%	17%

\* Numbers indicate grade-level tests.

† May not exactly match the sum of percent proficient and percent advanced due to rounding.

Table 7.B.1 through Table 7.B.3 in Appendix 7.B, starting on page 134, show the distributions of scale scores for each CMA. Table 7.B.4 presents analogous information for the grade-specific EOC mathematics testing groups.

The results are reported in terms of 15 score intervals, each of which contains 30 scale score points. A cell value of “N/A” indicates that there are no obtainable scale scores within that scale-score range for the particular CMA.

### Group Scores

Statistics summarizing student performance by content area and grade for selected groups of students are provided starting on page 136 in Table 7.C.1 through Table 7.C.19 for the CMA. When a test is administered at more than one grade level, the results are reported for all students tested and also by grade.

In these tables, students are grouped by demographic characteristics, including gender, ethnicity, English-language fluency, primary disability, and economic status. The tables show, for each demographic group, the numbers of valid cases, scale score means and standard deviations, the percentages of students in each performance level, as well as the mean percent correct in each reporting cluster.

Table 7.3 provides definitions of the demographic groups included in the tables. Students' economic status was determined by considering the education level of their parents and whether or not they participated in the National School Lunch Program (NSLP).

To protect privacy when the number of students in a subgroup is 10 or fewer, the summary statistics at the test- and reporting-cluster-level are not reported and are presented as hyphens. Percentages in these tables may not sum up to 100 due to rounding.

**Table 7.3 Subgroup Definitions**

Subgroup	Definition
Gender	<ul style="list-style-type: none"> <li>• Male</li> <li>• Female</li> </ul>
Ethnicity	<ul style="list-style-type: none"> <li>• American Indian or Alaska Native</li> <li>• Asian               <ul style="list-style-type: none"> <li>– Asian Indian</li> <li>– Cambodian</li> <li>– Chinese</li> </ul> </li> </ul>

Subgroup	Definition
English-language Fluency	<ul style="list-style-type: none"> <li>– Hmong</li> <li>– Japanese</li> <li>– Korean</li> <li>– Laotian</li> <li>– Vietnamese</li> <li>– Other Asian</li> <li>• Pacific Islander               <ul style="list-style-type: none"> <li>– Guamanian</li> <li>– Native Hawaiian</li> <li>– Samoan</li> <li>– Tahitian</li> <li>– Other Pacific Islander</li> </ul> </li> <li>• Filipino</li> <li>• Hispanic or Latino</li> <li>• African American</li> <li>• White (not Hispanic)</li> </ul>
Economic Status	<ul style="list-style-type: none"> <li>• English only</li> <li>• Initially fluent English proficient</li> <li>• English learner</li> <li>• Reclassified fluent English proficient</li> </ul>
Primary Disability	<ul style="list-style-type: none"> <li>• Not economically disadvantaged</li> <li>• Economically disadvantaged</li> <li>• Mental retardation/Intellectual disability (MR/ID)</li> <li>• Hard of hearing</li> <li>• Deafness</li> <li>• Speech or language impairment</li> <li>• Visual impairment</li> <li>• Emotional disturbance</li> <li>• Orthopedic impairment</li> <li>• Other health impairment</li> <li>• Specific learning impairment</li> <li>• Deaf blindness</li> <li>• Multiple group</li> <li>• Autism</li> <li>• Traumatic brain injury</li> </ul>

In addition to the subgroups presented in Table 7.3, the demographic tables also include grade-level data for the end-of-course mathematics CMA. The grades included for the end-of-course tests are as follows:

Grades	Test
7, 8, 9, 10, 11	Algebra I
8, 9, 10, 11	Geometry

## Reports Produced and Scores for Each Report

The tests that make up the STAR Program provide results or score summaries that are reported for different purposes. The four major purposes include:

1. Communicating with parents and guardians;
2. Informing decisions needed to support student achievement;
3. Evaluating school programs; and
4. Providing data for state and federal accountability programs for schools and districts.

A detailed description of the uses and applications of STAR reports is presented in the next section.

### Types of Score Reports

There are three categories of CMA reports. These categories and the specific reports in each category are given in Table 7.4.

**Table 7.4 Types of CMA Reports**

1. Summary Reports	<ul style="list-style-type: none"> <li>▪ STAR Student Master List Summary</li> <li>▪ STAR Student Master List Summary, End-of-Course</li> <li>▪ STAR Subgroup Summary (including the Ethnicity for Economic Status)</li> </ul>
2. Individual Reports	<ul style="list-style-type: none"> <li>▪ STAR Student Record Label</li> <li>▪ STAR Student Master List</li> <li>▪ STAR Student Report for CMA</li> </ul>
3. Internet Reports	<ul style="list-style-type: none"> <li>▪ CMA Scores (state, county, district, school)</li> <li>▪ CMA Summary Scores (state, county, district, school)</li> </ul>

These reports are sent to the independently testing charter schools, counties, or school districts; the school district forwards the appropriate reports to test sites or, in the case of the STAR Student Report, sends the report(s) to the child's parent or guardian and forwards a copy to the student's school or test site. Reports such as the STAR Student Report, Student Record Label, and Student Master List that include individual student results are not distributed beyond the student's school. Internet reports are described on the CDE Web site and are accessible to the public online at <http://star.cde.ca.gov/>.

Because results were pre-equated, individual student scores were also available to school districts approximately two weeks after scorable materials were received by the contractor by way of the QTR module to the STAR Management System. This module permits districts to download a file containing student data that includes scale scores and performance levels for multiple-choice CST and CMA tests taken.

### Score Report Contents

The STAR Student Report provides scale scores, performance levels, and reporting cluster (subscore) results for each CMA taken by the student. Scale scores are reported on a scale ranging from 150 to 600. The performance levels reported are: far below basic, below basic, basic, proficient, and advanced. These same scale scores and performance levels are available in the school district's QTR file.

In addition, percent-correct scores are provided at the cluster level. Also given for each cluster is the average percent-correct for proficient students, which is presented as a range

from the percent-correct score associated with the lowest proficient score on the total test to the percent-correct score associated with the lowest advanced score on the total test, less one percent. The average percent-correct estimates associated with the lowest proficient and advanced scores were obtained empirically for the tests that have sample sizes of 25 or more examinees at both the minimum proficient and the minimum advanced score levels. In cases where the available sample sizes were less than 25, “data smoothing” was conducted before obtaining the averages (Lu & Smith, 2009).

Students in grades four and seven also receive a numerical score (from 0–4) for the CMA writing task after QTR.

Reports for students with disabilities and English learners who use accommodations include a notation that indicates that the student used accommodations. Scores for students who use accommodations are reported in the same way as they are for nonaccommodated students.

Further information about the STAR Student Report and the other reports is provided in Appendix 7.D on page 174.

### **Score Report Applications**

CMA results provide parents and guardians with information about their child’s progress. The results are a tool for increasing communication and collaboration between parents or guardians and teachers. Along with report cards from teachers and information from school and classroom tests, the STAR Student Report can be used by parents and guardians while talking with teachers about ways to improve their child’s achievement of the California content standards.

Schools may use the CMA results to help make decisions about how best to support student achievement. CMA results, however, should never be used as the only source of information to make important decisions about a child’s education.

CMA results help school districts and schools identify strengths and weaknesses in their instructional programs. Each year, school districts and school staffs examine CMA results at each grade and content area tested. Their findings are used to help determine:

- The extent to which students are learning the academic standards,
- Instructional areas that can be improved,
- Teaching strategies that can be developed to address needs of students, and
- Decisions about how to use funds to ensure that students achieve the standards.

The results from the CMA are used for state and federal accountability programs to monitor each school’s and district’s progress toward achieving established goals. As mentioned previously, CMA results are used to calculate each school’s and district’s API. The API is a major component of California’s Public School Accountability Act (PSAA) and is used to rank the academic performance of schools, compare schools with similar characteristics (for example, size and ethnic makeup), identify low-performing and high-priority schools, and set yearly targets for academic growth.

CMA results also are used to comply with federal ESEA legislation that requires all schools to meet specific academic goals. The progress of each school toward achieving these goals is provided annually in an AYP report. Each year, California schools and districts must meet AYP goals by showing that a specified percentage of CMA test-takers at the district and

school levels are performing at or above the proficient level on the CMA in ELA and mathematics.

## **Criteria for Interpreting Test Scores**

A school district may use CMA results to help make decisions about student placement, promotion, retention, or other considerations related to student achievement. However, it is important to remember that a single test can provide only limited information. Other relevant information should be considered as well. It is advisable for parents to evaluate their child's strengths and weaknesses in the relevant topics by reviewing classroom work and progress reports in addition to the child's CMA results (CDE, 2013a). It is also important to note that a student's score in a content area contains measurement error and could vary somewhat if the student were retested.

## **Criteria for Interpreting Score Reports**

The information presented in various reports must be interpreted with caution when making performance comparisons. When comparing scale score and performance-level results for the CMA, the user is limited to comparisons within the same content area and grade. This is because the score scales are different for each content area and grade. The user may compare scale scores for the same content area and grade, within a school, between schools, or between a school and its district, its county, or the state. The user can also make comparisons within the same grade and content area across years. Comparing scores obtained in different grades or content areas should be avoided because the results are not on the same scale. Comparisons between raw scores or cluster scores should be limited to comparisons within not only content area and grade but also test year. For more details on the criteria for interpreting information provided on the score reports, see the *2013 STAR Post-Test Guide* (CDE, 2013b).

## Appendix 7.A—ELA for Writing (Grades Four and Seven) Rubrics

### Grade Four Scoring Rubric

The scoring rubric that follows was used to assign scores to students' written responses on the grade four writing tests. This rubric includes two sets of criteria. The criteria under "The Writing" are adapted from California's English-language arts content standards for Writing Strategies and Written Conventions of English. These criteria are used to evaluate on-demand, first-draft written responses in all genres. Student responses are evaluated on their clarity of purpose, central idea, and organization; their coherence; and their use of supporting evidence, sentence variety, and written conventions. The criteria under "Narrative writing," "Summary writing," and "Response to literature writing," adapted from the grade four Writing Applications content standards for these genres, are used to evaluate student writing in the specific genres to which they apply.

#### Score: 4

##### **The Writing:**

- *Clearly* addresses the writing task.
- Demonstrates a *clear* understanding of purpose.
- Maintains a *consistent* point of view, focus, and organizational structure, including paragraphing when appropriate.
- Includes a *clearly presented* central idea with *relevant* facts, details, and/or explanations.
- Includes sentence *variety*.
- Contains *some errors* in the conventions of the English language (grammar, punctuation, capitalization, and spelling). These errors do **not** interfere with the reader's understanding of the writing.

##### **Narrative writing:**

- Provides a *thoroughly developed* sequence of *significant* events to relate ideas, observations, and/or memories.
- Includes *vivid* descriptive language and sensory details that enable the reader to imagine the events or experiences.

##### **Summary writing:**

- Summarizes text with *clear* identification of the main idea(s) and the most significant details, in the student's own words.

##### **Response to literature writing:**

- Demonstrates a *clear* understanding of the literary work.
- Provides *effective* support for judgments through *specific* references to text and/or prior knowledge.

#### Score: 3

##### **The Writing:**

- Addresses *most* of the writing task.
- Demonstrates a *general* understanding of purpose.
- Maintains a *mostly consistent* point of view, focus, and organizational structure, including paragraphing when appropriate.
- Presents a central idea with *mostly* relevant facts, details, and/or explanations.
- Includes some sentence *variety*.

- Contains *errors* in the conventions of the English language (grammar, punctuation, capitalization, spelling). These errors do **not** interfere with the reader’s understanding of the writing.

**Narrative writing**

- Provides an *adequately developed* sequence of significant events to relate ideas, observations, and/or memories.
- Includes *some* descriptive language and sensory details that enable the reader to imagine the events or experiences.

**Summary writing**

- Summarizes text with the main idea(s) and important details, generally in the student’s own words.

**Response to literature writing**

- Demonstrates an understanding of the literary work.
- Provides *some* support for judgments through references to text and/or prior knowledge.

**Score: 2**

**The Writing:**

- Addresses *some* of the writing task.
- Demonstrates *little* understanding of purpose.
- Maintains an *inconsistent* point of view, focus, and/or organizational structure; may lack appropriate paragraphing.
- *Suggests* a central idea with *limited* facts, details, and/or explanations.
- Includes *little* sentence variety.
- Contains *many errors* in the conventions of the English language (grammar, punctuation, capitalization, spelling). These errors **may** interfere with the reader’s understanding of the writing.

**Narrative writing:**

- Provides a *minimally developed* sequence of events to relate ideas, observations, and/or memories.
- Includes *limited* descriptive language and sensory details that enable the reader to imagine the events or experiences.

**Summary writing:**

- Summarizes text with some of the main idea(s) and details, minimal use of student’s own words.

**Response to literature writing:**

- Demonstrates a *limited* understanding of the literary work.
- Provides *weak* support for judgments.

**Score: 1**

**The Writing:**

- Addresses *only one part*, if any, of the writing task.
- Demonstrates *no* understanding of purpose.
- *Lacks* a clear point of view, focus, and/or organizational structure; may contain inappropriate paragraphing.

- *Lacks* a central idea but may contain *marginally related* facts, details, and/or explanations.
- Includes *no* sentence variety.
- Contains *serious errors* in the conventions of the English language (grammar, punctuation, capitalization, spelling). These errors interfere with the reader's understanding of the writing.

***Narrative writing:***

- *Lacks* a sequence of events to relate ideas, observations, and/or memories.
- *Lacks* descriptive language and sensory details that enable the reader to imagine the events or experiences.

***Summary writing:***

- Summarizes text with few, if any, main idea(s) and/or details, little or no use of the student's own words.

***Response to literature writing:***

- Demonstrates *little or no* understanding of the literary work.
- *Fails* to provide support for judgments.

## Grade Seven Scoring Rubric

The scoring rubric that follows was used to assign scores to students' written responses on the grade seven writing tests. This rubric includes two sets of criteria. The criteria under "The Writing" are adapted from California's English–language arts content standards for Writing Strategies and Written Conventions of English. These criteria are used to evaluate on-demand, first-draft written responses in all genres. Student responses are evaluated on their clarity of purpose, central idea, and organization; their coherence; and their use of supporting evidence, sentence variety, and written conventions. The criteria under "Fictional or autobiographical narrative writing," "Response to literature writing," "Persuasive writing," and "Summary writing," adapted from the grade seven Writing Applications content standards for these genres, are used to evaluate student writing in the specific genres to which they apply.

### Score: 4

#### **The Writing:**

- Clearly addresses the writing task.
- Demonstrates a *clear* understanding of purpose and audience.
- Maintains a *consistent* point of view, focus, and organizational structure, including the *effective* use of transitions.
- Includes a *clearly presented* central idea with *relevant* facts, details, and/or explanations. (The relevancy of facts, details, and/or explanations is determined by the genre.)
- Includes sentence *variety*.
- Contains *some errors* in the conventions of the English language (grammar, punctuation, capitalization, spelling). These errors do **not** interfere with the reader's understanding of the writing.

#### **Fictional or autobiographical narrative writing:**

- Provides a *thoroughly developed* plot line, including major and minor characters and a *definite* setting.
- Includes *appropriate* strategies (e.g., dialogue; suspense; narrative action).

#### **Response to literature writing:**

- Develops interpretations that demonstrate a *thoughtful*, comprehensive grasp of the text.
- Organizes *accurate and coherent* interpretations around *clear* ideas, premises, or images from the literary work.
- Provides *specific* textual examples and details to support the interpretations.

#### **Persuasive writing:**

- *Authoritatively* defends a clear position with precise and relevant evidence and *convincingly* addresses the reader's concerns, biases, and expectations.

#### **Summary writing:**

- Summarizes text with clear identification of the main idea(s) and most significant details, in student's own words, and clearly reflects underlying meaning.

**Score: 3****The Writing:**

- Addresses most of the writing task.
- Demonstrates a *general* understanding of purpose and audience.
- Maintains a *mostly consistent* point of view, focus, and organizational structure, including use of isolated and/or single word transitions.
- Presents a central idea with *mostly relevant* facts, details, and/or explanations. (The relevancy of facts, details, and/or explanations is determined by the genre.)
- Includes some sentence *variety*.
- Contains *errors* in the conventions of the English language (grammar, punctuation, capitalization, spelling). These errors do **not** interfere with the reader's understanding of the writing.

**Fictional or autobiographical narrative writing:**

- Provides an *adequately developed* plot line, including major and minor characters and a *definite* setting.
- Includes *appropriate* strategies (e.g., dialogue; suspense; narrative action).

**Response to literature writing:**

- Develops interpretations that demonstrate a comprehensive grasp of the text.
- Organizes accurate and *reasonably* coherent interpretations around *clear* ideas, premises, or images from the literary work.
- Provides textual examples and details to support the interpretations.

**Persuasive writing**

- *Generally* defends a position with relevant evidence and addresses the reader's concerns, biases, and expectations.

**Summary writing**

- Summarizes text with the main idea(s) and *important* details, *mostly* in student's own words, and generally reflects underlying meaning.

**Score: 2****The Writing:**

- Addresses *some* of the writing task.
- Demonstrates *little* understanding of purpose and audience.
- Maintains an *inconsistent* point of view, focus, and/or organizational structure, which may include *ineffective or awkward* transitions that do not unify important ideas.
- *Suggests* a central idea with *limited* facts, details, and/or explanations. (The relevancy of facts, details, and/or explanations is determined by the genre.)
- Includes *little* sentence variety.
- Contains *many errors* in the conventions of the English language (grammar, punctuation, capitalization, spelling). These errors **may** interfere with the reader's understanding of the writing.

**Fictional or autobiographical narrative writing:**

- Provides a *minimally developed* plot line, including characters and a setting.
- *Attempts* to use strategies but with *minimal* effectiveness (e.g., dialogue; suspense; narrative action).

**Response to literature writing:**

- Develops interpretations that demonstrate a *limited* grasp of the text.
- Includes interpretations that *lack* accuracy or coherence as related to ideas, premises, or images from the literary work.
- Provides *few, if any*, textual examples and details to support the interpretations.

**Persuasive writing:**

- Defends a position with *little, if any*, evidence and *may* address the reader's concerns, biases, and expectations.

**Summary writing:**

- Summarizes text with *some* of the main idea(s) and details, which may be superficial, minimal use of the student's own words and minimal reflection of underlying meaning.

**Score: 1****The Writing:**

- Addresses *only one part*, if any, of the writing task.
- Demonstrates *no* understanding of purpose and audience.
- *Lacks* a point of view, focus, organizational structure, and transitions that unify important ideas.
- *Lacks* a central idea but may contain *marginally related* facts, details, and/or explanations. (The relevancy of facts, details, and/or explanations is determined by the genre.)
- Includes *no* sentence variety.
- Contains *serious errors* in the conventions of the English language (grammar, punctuation, capitalization, spelling). These errors interfere with the reader's understanding of the writing.

**Fictional or autobiographical narrative writing:**

- *Lacks* a developed plot line.
- *Fails* to use strategies (e.g., dialogue; suspense; narrative action).

**Response to literature writing:**

- Demonstrates *little* grasp of the text.
- *Lacks* an interpretation or may be a simple retelling of the passage.
- *Lacks* textual examples and details.

**Persuasive writing:**

- *Fails* to defend a position with *any* evidence and *fails* to address the reader's concerns, biases, and expectations.

**Summary writing:**

- Summarizes text with *few, if any*, of the main ideas and/or details, *little* or *no* use of the student's own words, *little* or *no* reflection of underlying meaning.

## Appendix 7.B—Scale Score Distribution Tables

*In Appendix 7.B, a cell value of “N/A” indicates that there are no obtainable scale scores within that scale-score range for the particular CMA.*

**Table 7.B.1 Distribution of CMA Scale Scores for ELA**

Scale Score	Grade 3	Grade 4	Grade 5	Grade 6	Grade 7	Grade 8	Grade 9	Grade 10	Grade 11
570 – 600	2	42	75	46	62	42	39	4	0
540 – 569	15	80	N/A	67	96	68	37	1	2
510 – 539	52	107	130	301	158	124	134	40	16

150 – 179	29	1

## Appendix 7.C—Demographic Summaries

To protect privacy when the number of students in a subgroup is 10 or fewer, the summary statistics at the test- and reporting-cluster-level are not reported and are presented as hyphens in the tables in Appendix 7.C. Percentages in these tables may not sum up to 100 due to rounding.

**Table 7.C.1 Demographic Summary for ELA, Grade Three**

	No. Tested	Mean Scale Scores	Std. Dev. of Scale Scores	Percent in Performance Level					Mean Percent Correct in Content Area		
				Far Below Basic	Below Basic	Basic	Proficient	Advanced	Vocabulary	Reading for Understanding	Language
All valid scores	19,966	308	64	10%	38%	26%	17%	10%	66%	55%	56%

## Appendix 7.D—Types of Score Reports

Table 7.D.1 Score Reports Reflecting CMA Results

2013 STAR CMA PRINTED REPORTS	
DESCRIPTION	DISTRIBUTION
<b>The CMA Student Report</b>	
<p>This report provides parents/guardians and teachers with the student's results, presented in tables and graphs.</p> <p>Data presented include the following:</p> <ul style="list-style-type: none"> <li>• Scale scores</li> <li>• Performance levels (advanced, proficient, basic, below basic, and far below basic)</li> <li>• Number and percent correct in each reporting cluster</li> <li>• Comparison of the student's scores on specific reporting clusters to the range of scores of students statewide who scored proficient on the total test</li> <li>• Writing response score and scoring rubric, for students in grades four and seven</li> </ul>	<p>This report includes individual student results and is not distributed beyond parents/guardians and the student's school.</p> <p>Two copies of this report are provided for each student. One is for the student's current teacher and one is distributed by the school district to parents/guardians.</p>
<b>Student Record Label</b>	
<p>These reports are printed on adhesive labels to be affixed to the student's permanent school records. Each student shall have an individual record of accomplishment that includes STAR testing results (see California <i>EC</i> Section 60607[a]).</p> <p>Data presented include the following for each content area tested:</p> <ul style="list-style-type: none"> <li>• Scale scores</li> <li>• Performance levels</li> </ul>	<p>This report includes individual student results and is not distributed beyond the student's school.</p>
<b>Student Master List</b>	
<p>This report is an alphabetical roster that presents individual student results. Data include the following:</p> <ul style="list-style-type: none"> <li>• Percent correct for each reporting cluster within each content area tested</li> <li>• A scale score and a performance level for each content area tested</li> <li>• Writing response score (CMA in grades four and seven only)</li> </ul>	<p>This report provides administrators and teachers with all students' results within each grade or within each grade and year-round schedule at a school.</p> <p>Because this report includes individual student results, it is not distributed beyond the student's school. It is recommended that Student Master List reports be retained until the grade level exits the school.</p>
<b>Student Master List Summary</b>	
<p>This report summarizes student results at the school, district, county, and state levels for each grade. It does not include any individual student information.</p> <p><b>Note:</b> Summaries for specific CMA tests for mathematics across grades are provided in the Student Master List Summary—End-of-Course</p>	<p>This report is a resource for evaluators, researchers, teachers, parents/guardians, community members, and administrators.</p> <p>One copy is packaged for the school and one for the school district.</p> <p>This report is also produced for school districts, counties, and the state.</p>

<b>2013 STAR CMA PRINTED REPORTS</b>	
<b>DESCRIPTION</b>	<b>DISTRIBUTION</b>
<p>report.</p> <p>For each CMA, the following data are summarized:</p> <ul style="list-style-type: none"> <li>• By content area tests: <ul style="list-style-type: none"> <li>– Number of students enrolled</li> <li>– Number and percent of students tested</li> <li>– Number and percent of valid scores</li> <li>– Number tested with scores</li> <li>– Mean percent correct</li> </ul> </li> <li>• Mean scale score</li> <li>• Scale score standard deviation</li> <li>• Number and percent of students scoring at each performance level</li> <li>• The number of items for each reporting cluster and the mean percent correct</li> <li>• For grades four and seven, the percent of students achieving each writing response score</li> </ul>	<p><b>Note:</b> The data in this report may be shared with parents/guardians, community members, and the media only if the data are for 11 or more students. It is recommended that summary reports be retained until the grade level exits the school.</p>
<b>Student Master List Summary—End of Course</b>	
<p>This report summarizes Student Master List information for the EOC CMA for Algebra I, administered to students in grades seven through eleven, and Geometry, administered to students in grades eight through eleven. It does not include any individual student information.</p> <p>For each of these CMA, the following data are summarized:</p> <ul style="list-style-type: none"> <li>• By content area tested: <ul style="list-style-type: none"> <li>– Number of students enrolled</li> <li>– Number and percent of students tested</li> <li>– Number and percent of valid scores</li> <li>– Number tested with scores</li> <li>– Mean percent correct</li> <li>– Mean scale score</li> <li>– Scale score standard deviation</li> <li>– Number and percent of students scoring at each performance level</li> </ul> </li> </ul> <p>For each reporting cluster:</p> <ul style="list-style-type: none"> <li>• Number of items</li> <li>• Mean percent correct</li> </ul>	<p>This report is a resource for evaluators, researchers, teachers, parents/guardians, community members, and administrators.</p> <p>One copy is packaged for the school and one for the school district.</p> <p>This report is also produced for school districts, counties, and the state.</p> <p><b>Note:</b> The data on this report may be shared with parents/guardians, community members, and the media only if the data are for 11 or more students. It is recommended that summary reports be retained until the grade level exits the school.</p>
<b>Subgroup Summary</b>	
<p>This set of reports disaggregates and reports results by the following subgroups:</p> <ul style="list-style-type: none"> <li>• All students</li> <li>• Disability status</li> <li>• Economic status</li> </ul>	<p>This report is a resource for evaluators, researchers, teachers, parents/guardians, community members, and administrators.</p> <p>One copy is packaged for the school and one for the school district.</p>

<b>2013 STAR CMA PRINTED REPORTS</b>	
<b>DESCRIPTION</b>	<b>DISTRIBUTION</b>
<ul style="list-style-type: none"> <li>• Gender</li> <li>• English proficiency</li> <li>• Primary ethnicity</li> </ul> <p>These reports contain no individual student-identifying information and are aggregated at the school, district, county, and state levels.</p> <p>For each subgroup within a report and for the total number of students, the following data are included for each test:</p> <ul style="list-style-type: none"> <li>• Total number tested in the subgroup</li> <li>• Percent of enrollment tested in the subgroup</li> <li>• Number and percent of valid scores</li> <li>• Number tested who received scores</li> <li>• Mean scale score</li> <li>• Standard deviation of scale score</li> <li>• Number and percent of students scoring at each performance level</li> </ul>	<p>This report is also produced for school districts, counties, and the state.</p> <p><b>Note:</b> The data on this report may be shared with parents/guardians, community members, and the media only if the data are for 11 or more students. It is recommended that summary reports be retained until the grade level exits the school.</p>
<b>Subgroup Summary—Ethnicity for Economic Status</b>	
<p>This report, a part of the Subgroup Summary, disaggregates and reports results by cross-referencing each ethnicity with economic status. The economic status for each student is “economically disadvantaged,” “not economically disadvantaged,” or “economic status unknown.” A student is defined as “economically disadvantaged” if the most educated parent of the student, as indicated in the answer document or Pre-ID, has not received a high school diploma or the student is eligible to participate in the free or reduced-price lunch program also known as the National School Lunch Program (NSLP).</p> <p>As with the standard Subgroup Summary, this disaggregation contains no individual student-identifying information and is aggregated at the school, district, county, and state levels.</p> <p>For each subgroup within a report, and for the total number of students, the following data are included:</p> <ul style="list-style-type: none"> <li>• Total number tested in the subgroup</li> <li>• Percent of enrollment tested in the subgroup</li> <li>• Number and percent of valid scores</li> <li>• Number tested who received scores</li> <li>• Mean scale scores</li> <li>• Standard deviation of scale scores</li> <li>• Number and percent of students scoring at each performance level</li> </ul>	<p>This report is a resource for evaluators, researchers, teachers, parents/guardians, community members, and administrators.</p> <p>One copy is packaged for the school and one for the school district.</p> <p>This report is also produced for school districts, counties, and the state.</p> <p><b>Note:</b> The data on this report may be shared with parents/guardians, community members, and the media only if the data are for 11 or more students. It is recommended that summary reports be retained until the grade level exits the school.</p>

# Chapter 8: Analyses

---

## Background

This chapter summarizes the item- and test-level statistics obtained for the CMA administered during the spring of 2013.

The statistics presented in this chapter are divided into five sections in the following order:

1. Classical Item Analyses
2. Reliability Analyses
3. Analyses in Support of Validity Evidence
4. Item Response Theory (IRT) Analyses
5. Differential Item Functioning (DIF) Analyses

Each of those sets of analyses is presented in the body of the text and in the appendixes as listed below.

1. Appendix 8.A on page 203 presents the classical item analyses, including proportion-correct value ( $p$ -value) and point-biserial correlation (Pt-Bis) for each item in each operational test. Because all forms were reused,  $p$ -values and Pt-Bis are shown for both the original and the current administration of the tests. The appendix also presents information about the distribution of scores on the writing tasks administered in grades four and seven for the overall population and for the various subgroups. In addition, the average and median  $p$ -value and Pt-Bis for the operational test forms based on the current administrations are presented in Table 8.1 on page 179.
2. Appendix 8.B on page 216 presents results of the reliability analyses of total test scores and subscores for the population as a whole and for selected subgroups. Also presented are results of the analyses of the accuracy and consistency of the performance classifications. Finally, interrater reliability results for the writing tasks administered in grades four and seven are shown.
3. Appendix 8.C on page 263 presents tables showing the correlation between scores obtained on the CMA measured in the different content areas, which are provided as an example of the evidence of the validity of the interpretation and uses of CMA scores. The results for the overall test population are presented in Table 8.5; the tables in Appendix 8.C summarize the results for various subgroups.
4. Appendix 8.D on page 272 presents the results of IRT analyses, including the distribution of items based on their fit to the Rasch model and the summaries of Rasch item difficulty statistics ( $b$ -values) for the field-test items administered for the first time in 2013 in the CMA for ELA in grades nine through eleven, EOC mathematics Algebra I and Geometry, and Life Science in grade ten. (For the summaries of  $b$ -values for all CMA operational items, refer to Appendix D of the *CMA Technical Report* in the year the form was administered originally; see Table 8.4 on page 190 for administration years.) In addition, the appendix presents the scoring tables with frequency for each score point.
5. Appendix 8.E on page 286 presents the results of the DIF analyses applied to field-test items administered for the first time in 2013 for ELA in grades nine through eleven, EOC mathematics Algebra I and Geometry, and Life Science in grade ten for which sufficient student samples were available. In this appendix, items flagged for significant DIF are listed. Also given are the distributions of items across DIF

categories. Because forms are reused and there are no new field-test items, DIF analyses were not performed in 2013 for ELA in grades three through eight, mathematics in grades three through seven, and science in grades five and eight.

## Samples Used for the Analyses

CMA analyses were conducted at different times after test administration and involved varying proportions of the full CMA data. The classical item analyses presented in Appendix 8.A, the reliability statistics included in Appendix 8.B, the content-area correlations presented in Appendix 8.C, the IRT results presented in Appendix 8.D, and the item-level DIF results for field-test items administered for the first time in 2013 presented in Appendix 8.E were calculated using the P2 data file, which contained the entire test-taking population and all the student records used in the August 8, 2013, reporting of STAR results.

Following the *Standards for Educational and Psychological Testing* (American Educational Research Association [AERA], American Psychological Association [APA], & National Council on Measurement in Education [NCME], 1999, Standard 6.4), the results of the classical item analyses and reliability analyses for the EOC mathematics CMA in Algebra I and Geometry are also presented for the grade-specific population in addition to the overall test-taking population. “Grade-specific population” refers to test-takers in the particular grade for which the course has been recommended by the SBE, that is, in grade eight for Algebra I and grade nine for Geometry. No grade-specific DIF or IRT analyses were conducted for these tests.

## Classical Item Analyses

### Multiple-choice Items

The classical item statistics that included overall and item-by-item proportion-correct indices and the point-biserial correlation indices were computed for the operational items. The  $p$ -value of an item represents the proportion of examinees in the sample that answered an item correctly. The formula for  $p$ -value is:

$$p\text{-value}_i = \frac{N_{ic}}{N_i} \quad (8.1)$$

where,

$N_{ic}$  is the number of examinees that answered item  $i$  correctly, and

$N_i$  is the total number of examinees that attempted the item.

The point-biserial correlation is a special case of the Pearson product-moment correlation used to measure the strength of the relationship between two variables, one dichotomously and one continuously measured—in this case, the item score (right/wrong) and the total test score. The formula for the Pearson product-moment correlation is:

$$r_{X_i T} = \frac{\text{cov}(X_i, T)}{s_{X_i} s_T} \quad (8.2)$$

where,

$\text{cov}(X_i, T)$  is the covariance between the score of item  $i$  and total score  $T$ ,

$s_{X_i}$  is the standard deviation for the score of item  $i$ , and

$s_T$  is the standard deviation for total score  $T$ .

The classical statistics for the current administration of the overall test are presented in Table 8.1. The item-by-item values for the indices are presented in Table 8.A.1 through Table 8.A.6, starting on page 203. Each set of values is presented for both the current and the original presentation of each CMA.

**Table 8.1 Mean and Median Proportion Correct and Point-Biserial Correlation—Current Administration**

Subject	CMA *	Admin. Year	No. of Items	No. of Examinees	Mean		Median

## Writing Tasks

As described earlier, students in grades four and seven were administered two different writing prompts at different times in the STAR testing cycle. Students were given one of the two writing prompts depending upon when they were tested.

The distributions of writing scores for the overall population and for the various subgroups are presented in Table 8.A.7 and Table 8.A.8, which appear starting on page 212. The subgroups include gender, ethnicity, economic status, primary disability, and English-language fluency.

The mean scores obtained on the writing test for the overall population and for various subgroups are presented in Table 8.A.9 and Table 8.A.10. To quantify the differences between mean scores of subgroups, effect sizes were calculated; Cohen's *d* (1992) was used as the measure of effect size. Cohen's *d* is defined as the difference between two means divided by the pooled standard deviation adjusted for sample size. Cohen (1992) suggested that 0.2 is indicative of a small effect, 0.5 a medium, and 0.8 a large effect size. The effect sizes for various subgroup differences are presented in Table 8.A.11 and Table 8.A.12.

In 2013, the writing score is not included in the total ELA score that is used to calculate student scale scores.

## Reliability Analyses

Reliability focuses on the extent to which differences in test scores reflect true differences in the knowledge, ability, or skill being tested, rather than fluctuations due to chance or random factors. The variance in the distribution of test scores—essentially, the differences among individuals—is partly due to real differences in the knowledge, skill, or ability being tested (true-score variance) and partly due to random unsystematic errors in the measurement process (error variance).

The number used to describe reliability is an estimate of the proportion of the total variance that is true-score variance. Several different ways of estimating this proportion exist. The estimates of reliability reported here are internal-consistency measures, which are derived from analysis of the consistency of the performance of individuals on items within a test (internal-consistency reliability). Therefore, they apply only to the test form being analyzed. They do not take into account form-to-form variation due to equating limitations or lack of parallelism, nor are they responsive to day-to-day variation due, for example, to students' state of health or testing environment.

Reliability coefficients may range from 0 to 1. The higher the reliability coefficient for a set of scores, the more likely individuals would be to obtain very similar scores if they were retested. The formula for the internal-consistency reliability as measured by Cronbach's Alpha (Cronbach, 1951) is defined by equation 8.3:

$$\alpha = \frac{n}{n-1} \left[ 1 - \frac{\sum_{i=1}^n s_i^2}{s_t^2} \right] \quad (8.3)$$

where,

$n$  is the number of items,

$s_i^2$  is the variance of scores on the item  $i$ , and

$s_t^2$  is the variance of the total score.

The standard error of measurement (SEM) provides a measure of score instability in the score metric. The SEM was computed as shown in equation 8.4:

$$s_e = s_t \sqrt{1 - \alpha} \quad (8.4)$$

where,

$\alpha$  is the reliability estimated in equation 8.3, and

$s_t$  is the standard deviation of the total score (either the total raw score or scale score).

The SEM is particularly useful in determining the confidence interval (CI) that captures an examinee's true score. Assuming that measurement error is normally distributed, it can be said that upon infinite replications of the testing occasion, approximately 95 percent of the CIs of  $\pm 1.96$  SEM around the observed score would contain an examinee's true score (Crocker & Algina, 1986). For example, if an examinee's observed score on a given test equals 15 points, and the SEM equals 1.92, one can be 95 percent confident that the

examinee's true score lies between 11 and 19 points ( $15 \pm 3.76$  rounded to the nearest integer).

Table 8.2 gives the reliability and SEM for each of the 19 operational CMA, along with the number of items and examinees upon which those analyses were performed. The results for the grade-specific population for the EOC mathematics Algebra I and Geometry are also presented in this table.

**Table 8.2 Reliabilities and SEMs for the CMA**

### Intercorrelations, Reliabilities, and SEMs for Reporting Clusters

For each CMA, number-correct scores are computed for the reporting clusters—three in all tests except for the CMA for science in grades eight and ten, Algebra I, and Geometry, which have four. The number of items within each reporting cluster is limited, and cluster scores alone should not be used in making inferences about individual students.

Intercorrelations and reliability estimates for the reporting clusters are presented in Table 8.B.1 through Table 8.B.3 starting on page 216. Results are also reported in Table 8.B.4 for grade-specific samples of the mathematics tests of Algebra I and Geometry. Consistent with results from previous years, the reliabilities across reporting clusters vary significantly according to the number of items in each cluster.

### Subgroup Reliabilities and SEMs

The reliabilities of the 19 operational CMA and the two grade-specific CMA were examined for various subgroups of the examinee population. The subgroups included in these analyses were defined by their gender, ethnicity, economic status, primary disability, and

English-language fluency. The reliability analyses are also presented by ethnicity within economic status.

Reliabilities and SEM information for the total test scores and the reporting cluster scores are reported for each subgroup analysis. Table 8.B.5 through Table 8.B.8 present the reliabilities for the subgroups based on gender, economic status, English-language fluency, and primary ethnicity. The next set of tables, Table 8.B.9 through Table 8.B.11, shows the same analyses for the subgroups based on primary ethnicity within economic status and gender within economic status. Table 8.B.12 and Table 8.B.13 present the reliabilities for subgroups based on primary disability.

Test-level reliabilities for the various subgroups are compiled in Table 8.B.14 through Table 8.B.20. The corresponding cluster-level reliabilities are provided in Table 8.B.21 through Table 8.B.48.

Note that the reliabilities are reported only for samples that are comprised of 11 or more examinees. Also, in some cases, score reliabilities were not estimable and are presented in the tables as hyphens. Finally, results based on samples that contain 50 or fewer examinees should be interpreted with caution due to small sample sizes.

### Conditional Standard Errors of Measurement

As part of the IRT-based equating procedures, scale-score conversion tables and conditional standard errors of measurement (CSEMs) are produced. CSEMs for CMA scale scores are based on IRT and are calculated by the IRTEQUATE module in a computer system called the Generalized Analysis System (GENASYS).

The CSEM is estimated as a function of measured ability. It is typically smaller in scale-score units toward the center of the scale in the test metric, where more items are located, and larger at the extremes, where there are fewer items. An examinee's CSEM under the IRT framework is equal to the inverse of the square root of the test information function:

$$\text{CSEM}(\hat{\theta}) = \frac{1}{\sqrt{I(\hat{\theta})}} a \quad (8.5)$$

where,

CSEM( $\hat{\theta}$ ) is the standard error of measurement, and

$I(\hat{\theta})$  is the test information function at ability level  $\hat{\theta}$ .

The statistic is multiplied by  $a$ , where  $a$  is the original scaling factor needed to transform theta to the scale-score metric. The value of  $a$  varies by grade and content area.

SEMs vary across the scale. When a test has cut scores, it is important to provide CSEMs at the cut scores.

Table 8.3 presents the scale score CSEMs at the lowest score required for a student to be classified in the below basic, basic, proficient, and advanced performance levels for each CMA.

The CSEMs tend to be higher at the advanced cut points for all tests. The pattern of lower values of CSEMs at the basic and proficient levels are expected since (1) more items tend to be of middle difficulty; and (2) items at the extremes still provide information toward the middle of the scale. This results in more precise scores in the middle of the scale and less precise scores at the extremes of the scale.

**Table 8.3 Scale Score CSEM at Performance-level Cut Points**

Content Area	CMA *	Below Basic		Basic		Proficient		Advanced

## Decision Classification Analyses

The methodology used for estimating the reliability of classification decisions is described in Livingston and Lewis (1995) and is implemented using the ETS-proprietary computer program RELCLASS-COMP (Version 4.14).

Decision accuracy describes the extent to which examinees are classified in the same way as they would be on the basis of the average of all possible forms of a test. Decision accuracy answers the following question: How does the actual classification of test-takers, based on their single-form scores, agree with the classification that would be made on the basis of their true scores, if their true scores were somehow known? RELCLASS-COMP also estimates decision accuracy using an estimated multivariate distribution of reported classifications on the current form of the test and the classifications based on an all-forms average (true score).

Decision consistency describes the extent to which examinees are classified in the same way as they would be on the basis of a single form of a test other than the one for which data are available. Decision consistency answers the following question: What is the agreement between the classifications based on two nonoverlapping, equally difficult forms of the test? RELCLASS-COMP estimates decision consistency using an estimated multivariate distribution of reported classifications on the current form of the test and classifications on a hypothetical alternate form using the reliability of the test and strong true-score theory.

In each case, the proportion of classifications with exact agreement is the sum of the entries in the diagonal of the contingency table representing the multivariate distribution. Reliability of classification at a cut score is estimated by collapsing the multivariate distribution at the

passing score boundary into an  $n$  by  $n$  table (where  $n$  is the number of performance levels) and summing the entries in the diagonal. Figure 8.1 and Figure 8.2 present the two scenarios graphically.

**Figure 8.1 Decision Accuracy for Achieving a Performance Level**

		Decision made on a form actually taken	
		Does not achieve a performance level	Achieves a performance level
True status on all-forms average	Does not achieve a performance level	Correct classification	Misclassification
	Achieves a performance level	Misclassification	Correct classification

**Figure 8.2 Decision Consistency for Achieving a Performance Level**

		Decision made on the alternate form taken	
		Does not achieve a performance level	Achieves a performance level
Decision made on the form taken	Does not achieve a performance level	Correct classification	Misclassification
	Achieves a performance level	Misclassification	Correct classification

The results of these analyses are presented in Table 8.B.49 through Table 8.B.69 in Appendix 8.B. For the CMA for ELA in grades four and seven, the decision classification analyses are based on scores of the multiple-choice items only because the writing component score is not a part of the total ELA score.

Each table includes the contingency tables for both accuracy and consistency of the various performance-level classifications. The proportion of students being accurately classified is determined by summing across the diagonals of the upper tables. The proportion of consistently classified students is determined by summing the diagonals of the lower tables.

The classifications are collapsed to below-proficient versus proficient and above, which are the critical categories for Adequate Yearly Progress (AYP) calculations and are also presented in the tables.

### Writing Score Reliability

The reliability of the writing task can be estimated indirectly by examining the correlation between the MC and writing components in relation to the MC reliability. The lower bound reliability for a constructed-response (CR) item in a test with MC items and only one CR item can be estimated using the squared correlation between the MC and writing (CR) portions of the test and dividing by the reliability of the MC portion of the test ( $[Corr_{Writing-MC}]^2 / Rel_{MC}$ ) (Sax, 1989).

The reliability estimates for the multiple-choice scores were 0.83 for grade four and 0.87 for grade seven. The approximate lower bound reliability for the essay scores was estimated to be 0.21 and 0.22 for the two grades, respectively.

## Prompt and Rater Agreement Summary

As described earlier, in order to monitor the accuracy of ratings, two raters scored approximately 10 percent of the examinees' writing responses. The two sets of ratings were used to carry out interrater agreement and generalizability analyses to assess the reliability of the writing scores.

### Interrater Reliability Analyses

In the context of essay scoring, interrater reliability or consistency is defined as the degree of agreement between ratings or scores assigned by two or more readers to a given response. It is an indicator of homogeneity and is most frequently measured using intraclass correlation coefficient (ICC), which incorporates the exact agreement between raters over and above that expected by chance. The index is defined as the following:

$$ICC = r_1 = (m_{S_{\text{between}}} - m_{S_{\text{within}}}) / (m_{S_{\text{between}}} + [k - 1]m_{S_{\text{within}}}) \quad (8.6)$$

where,

$m_{S_{\text{between}}}$  is the mean-square estimate of between-subjects variance, and

$m_{S_{\text{within}}}$  is the mean-square estimate of within-subjects variance.

For categorical ratings, Cohen's Kappa statistic has the properties of an intraclass correlation coefficient and can be used for interrater reliability. Cohen's Kappa was therefore used as a primary indicator of the interrater reliability of the writing scoring. In addition, the percentages of ratings on which the raters were in exact agreement or differed by just one point were computed.

The reliability analyses were performed on the approximately 10 percent of the overall testing population that were scored by two raters. From those double-scored writing responses, samples were selected that had valid ratings (1, 2, 3, or 4) for both raters (see Appendix 7.A on page 128 for the writing scoring rubrics). Zero is a valid score for the writing responses but was not provided by a rater. Instead, a score of zero was assigned when the student attempted the writing task but either did not provide a response, refused to provide a response, or responded to a writing task from an earlier administration.

The results of interrater analyses are presented in Table 8.B.70 and Table 8.B.71 in Appendix 8.B. Table 8.B.72 and Table 8.B.73 provide descriptive statistics of the ratings by the two raters.

### Generalizability Analyses

Generalizability analyses were performed on the writing scores to quantify the proportion of variance explained by various possible sources of variation including raters, writing prompt, and persons (desired variance). A generalizability study (g-study) was performed to estimate variance components for selected sources of variation also known as "facets." A d-study was performed to estimate the generalizability coefficient (Brennan, 2001a; Crocker & Algina, 1986).

The computer programs GENOVA and its extension, urGENOVA, were used to carry out these analyses (Brennan, 2001b; Crick & Brennan, 1983). Since two raters scored each student's response but each student did not receive the same prompt, a nested unbalanced design was used (Lee & Kantor, 2005; Wang et al., 2007) as described below:

$$\text{Design} = (\text{Person} : \text{Task}) \times \text{Rater}$$

The model assumes that the raters are selected from an infinite pool of raters and all the raters are randomly equivalent. The model also assumes that the writing prompts are randomly selected from a universe of prompts and that students' writing responses are randomly assigned to the raters. The results of the study are presented in Table 8.B.74 and Table 8.B.75 on page 262.

## Validity Evidence

Validity refers to the degree to which each interpretation or use of a test score is supported by evidence that is gathered (AERA, APA, & NCME, 1999; ETS, 2002). It is a central concern underlying the development, administration, and scoring of a test and the uses and interpretations of test scores.

Validation is the process of accumulating evidence to support each proposed score interpretation or use. It involves more than a single study or gathering of one particular kind of evidence. Validation involves multiple investigations and various kinds of evidence (AERA, APA, & NCME, 1999; Cronbach, 1971; ETS, 2002; Kane, 2006). The process begins with test design and continues through the entire assessment process, including item development and field testing, analyses of item and test data, test scaling, scoring, and score reporting.

This section presents the evidence gathered to support the intended uses and interpretations of scores for the CMA testing program. The description is organized in the manner prescribed by *The Standards for Educational and Psychological Testing* (AERA, APA, & NCME, 1999). These standards require a clear definition of the purpose of the test, which includes a description of the qualities—called constructs—that are to be assessed by a test, the population to be assessed, as well as how the scores are to be interpreted and used.

In addition, the *Standards* identify five kinds of evidence that can provide support for score interpretations and uses, which are as follows:

1. Evidence based on test content;
2. Evidence based on relations to other variables;
3. Evidence based on response processes;
4. Evidence based on internal structure; and
5. Evidence based on the consequences of testing.

These kinds of evidence are also defined as important elements of validity information in documents developed by the U.S. Department of Education for the peer review of testing programs administered by states in response to the Elementary and Secondary Education Act (USDOE, 2001).

The next section defines the purposes of the CMA, followed by a description and discussion of the kinds of validity evidence that have been gathered.

## Purposes of the CMA

As mentioned in Chapter 1, the CMA test results contribute to calculating school and district API. Additionally, the CMA for ELA and mathematics are used in determining AYP that applies toward meeting the requirement of the federal Elementary and Secondary Education Act (ESEA), which is to have all students score at proficient or above by 2014.

## The Constructs to Be Measured

The tests of the CMA, given in English, are designed to show how well students perform relative to the California content standards. These content standards were approved by the SBE; they describe what students should know and be able to do at each grade level.

Test blueprints and specifications written to define the procedures used to measure the content standards provide an operational definition of the construct to which each set of standards refers—that is, they define, for each content area to be assessed, the tasks to be presented, the administration instructions to be given, and the rules used to score examinee responses. They control as many aspects of the measurement procedure as possible so that the testing conditions will remain the same over test administrations (Cronbach, 1971; Cronbach, Gleser, Nanda, & Rajaratnam, 1972) to minimize construct-irrelevant score variance (Messick, 1989). The content blueprints for the CMA can be found on the CDE STAR CMA Blueprints Web page at <http://www.cde.ca.gov/ta/tg/sr/cmablueprints.asp>. ETS has developed all CMA test items to conform to the SBE-approved content standards and test blueprints.

## Interpretations and Uses of the Scores Generated

Total test scores expressed as scale scores, student performance levels, and subscores for each reporting cluster are generated for each grade-level and content-area test. The total test scale score is used to draw inferences about a student's achievement in the content area and to classify the achievement into one of five performance levels: advanced, proficient, basic, below basic, and far below basic.

Reporting cluster scores, also called subscores, are used to draw inferences about a student's achievement in each of several specific knowledge or skill areas covered by each test. Reporting cluster results compare an individual student's percent-correct score to the average percent-correct for the state as a whole. The range of scores for students who scored proficient on the total test is also provided for each cluster using a percent-correct metric. The reference points for this range are: (1) the average percent-correct for students who received the lowest score qualifying for the proficient performance level; and (2) the average percent-correct for students who received the lowest score qualifying for the advanced performance level, minus one percent. A detailed description of the uses and applications of CMA scores is presented in Chapter 7, which starts on page 115.

The tests that make up the STAR Program, along with other assessments, provide results or score summaries that are used for different purposes. The four major purposes are:

1. Communicating with parents and guardians;
2. Informing decisions needed to support student achievement;
3. Evaluating school programs; and
4. Providing data for state and federal accountability programs for schools.

These are the only uses and interpretations of scores for which validity evidence has been gathered. If the user wishes to interpret or use the scores in other ways, the user is cautioned that the validity of doing so has not been established (AERA, APA, & NCME, 1999, Standard 1.3). The user is advised to gather evidence to support these additional interpretations or uses (AERA, APA, & NCME, 1999, Standard 1.4).

## Intended Test Population(s)

California public school students who meet certain eligibility criteria are the intended test population for the CMA. Students in grades three through eleven are tested in ELA;

students in grades three through seven are tested in mathematics; and students in grades five, eight, and ten are tested in science. In addition, students in grades seven through eleven can take the EOC CMA for Algebra I, and students in grades eight through eleven can take the EOC CMA for Geometry. In grade seven, students take either grade-level mathematics or EOC Algebra I. Only those students whose parents/guardians have submitted written requests to exempt them from STAR Program testing do not take the tests.

## Validity Evidence Collected

### Evidence Based on Content

According to *The Standards for Educational and Psychological Testing* (AERA, APA, & NCME, 1999), analyses that demonstrate a strong relationship between a test's content and the construct that the test was designed to measure can provide important evidence of validity. In current K–12 testing, the construct of interest usually is operationally defined by state content standards and the test blueprints that specify the content, format, and scoring of items that are admissible measures of the knowledge and skills described in the content standards. Evidence that the items meet these specifications and represent the domain of knowledge and skills referenced by the standards supports the inference that students' scores on these items can appropriately be regarded as measures of the intended construct.

As noted in the AERA, APA, and NCME *Test Standards* (1999), evidence based on test content may involve logical analyses of test content in which experts judge the adequacy with which the test content conforms to the test specifications and represents the intended domain of content. Such reviews can also be used to determine whether the test content contains material that is not relevant to the construct of interest. Analyses of test content may also involve the use of empirical evidence of item quality.

Also to be considered in evaluating test content are the procedures used for test administration and test scoring. As Kane (2006, p. 29) has noted, although evidence that appropriate administration and scoring procedures have been used does not provide compelling evidence to support a particular score interpretation or use, such evidence may prove useful in refuting rival explanations of test results. Evidence based on content includes the following:

**Description of the state standards**—As was noted in Chapter 1, the SBE adopted rigorous content standards in 1997 and 1998 in four major content areas: ELA, history–social science, mathematics, and science. These standards were designed to guide instruction and learning for all students in the state and to bring California students to world-class levels of achievement.

**Specifications and blueprints**—ETS maintains item specifications for each CMA. The item specifications describe the characteristics of the items that should be written to measure each content standard. A thorough description of the specifications can be found in Chapter 3, starting on page 60. Once the items were developed and field-tested, ETS selected all CMA test items to conform to the SBE-approved California content standards and test blueprints. Test blueprints for the CMA were proposed by ETS and reviewed and approved by the Assessment Review Panels (ARPs), which are advisory panels to the CDE and ETS on areas related to item development for the CMA. Test blueprints were also reviewed and approved by the CDE and presented to the SBE for adoption. There have been no recent changes in the blueprints for the CMA. The test blueprints for the

CMA can be found on the CDE STAR CMA Blueprints Web page at <http://www.cde.ca.gov/ta/tg/sr/cmablueprints.asp>.

**Item development process**—A detailed description of the item development process for the CMA is presented in Chapter 3, starting on page 60.

**Item review process**—Chapter 3 explains in detail the extensive item review process applied to items that were written for use in the CMA. In brief, items written for the CMA underwent multiple review cycles and involved multiple groups of reviewers. One of the reviews was carried out by an external reviewer, that is, the ARPs. The ARPs were responsible for reviewing all newly developed items for alignment to the California content standards.

**Form construction process**—For each test, the content standards, blueprints, and test specifications were used as the basis for choosing items for the initial year of their use in a form. Additional targets for item difficulty and discrimination that were used for test construction were defined in light of what are desirable statistical characteristics in test items and statistical evaluations of the CMA items.

Guidelines for test construction were established with the goal of maintaining parallel forms to the greatest extent possible from year to year. Details can be found in Chapter 4, starting on page 72.

Additionally, an external review panel, the Statewide Pupil Assessment Review (SPAR), was responsible for reviewing and approving the achievement tests to be used statewide for the testing of students in California public schools, grades two through eleven. More information about the SPAR is given in Chapter 3, starting on page 67.

### **Evidence Based on Relations to Other Variables**

Empirical results concerning the relationships between the score on a test and measures of other variables external to the test can also provide evidence of validity when these relationships are found to be consistent with the definition of the construct that the test is intended to measure. As indicated in the *Test Standards* (AERA, APA, & NCME, 1999), the variables investigated can include other tests that measure the same construct and different constructs, criterion measures that scores on the test are expected to predict, as well as demographic characteristics of examinees that are expected to be related and unrelated to test performance.

### **Differential Item Functioning Analyses**

Analyses of DIF can provide evidence of the degree to which a score interpretation or use is valid for individuals who differ in particular demographic characteristics. For the CMA, DIF analyses were performed on field-test items that were administered for the first time in 2013 for the CMA for ELA in grades nine through eleven, EOC mathematics Algebra I and Geometry, and Life Science in grade ten for which sufficient student samples were available.

The results of the DIF analyses for the field-test items are presented in Appendix 8.E, which starts on page 286. The vast majority of the items exhibited little or no significant DIF, suggesting that, in general, scores based on the CMA items would have the same meaning for individuals who differed in their demographic characteristics.

Results of the DIF analyses for operational items are presented in Appendix 8.E of the *CMA Technical Report* produced for the year the form was originally administered. Reports are linked on the CDE's Technical Reports and Studies Web page at

<http://www.cde.ca.gov/ta/tg/sr/technicalrpts.asp>. The year of original administration for each multiple-choice CMA is shown in Table 8.4.

**Table 8.4 Original Year of Administration for the CMA**

Content Area	CMA *	Year

\* CMA named by number only are grade-level tests.

### Correlations Between Content-area Test Scores

To the degree that students' content-area test scores correlate as expected, evidence of the validity in regarding those scores as measures of the intended constructs is provided. Table 8.5 provides the correlations between scores on the 2013 CMA content-area tests and the numbers of students on which these correlations were based. Sample sizes for individual tests are shown in bold font on the diagonals of the correlation matrices, and the numbers of students on which the correlations were based are shown on the lower off-diagonals. The correlations are provided in the upper off-diagonals. Results are based on all students with valid CMA scores and are provided by grade to account for different course-taking patterns in the upper grades.

Results for these students appear to be consistent with expectations. In general, students' ELA scores correlated moderately with their mathematics scores. They correlated more highly with their scores on the science CMA.

Table 8.C.1 through Table 8.C.9 in Appendix 8.C provide the content-area test score correlations by gender, ethnicity, English-language fluency, economic status, and primary disability. Similar patterns of correlations between students' ELA, mathematics, and science scores were found within the subgroups.

Note that while the correlations are reported only for samples that comprise 11 or more examinees, results based on samples that contain 50 or fewer examinees should be interpreted with caution due to small sample sizes. Correlations between scores on any two content-area tests where 10 or fewer examinees have valid scores are expressed as hyphens. Correlations between scores on two content-area tests that cannot be administered together to the same group of students are expressed as "N/A."

**Note:** Due to limited column space, test names were not repeated on the column heading of each correlation matrix in Table 8.C.1 through Table 8.C.9. Instead, numerical headings, such as "1." or "2." were used.

**Table 8.5 CMA Content-area Correlations (All Valid Scores)**

Grade	CMA	ELA	Mathematics		
3	ELA	<b>19,966</b>	0.61		
	Mathematics	15,840	<b>17,267</b>

Grade	CMA	ELA	Algebra I	Geometry	
11	ELA	<b>16,343</b>	0.39	0.47	
	Algebra I	4,454	<b>5,109</b>	N/A	
	Geometry	3,076	N/A	<b>3,644</b>	

Correlations between the reporting cluster scores are presented in Table 8.B.1 through Table 8.B.3 for the CMA. Results are also reported in Table 8.B.4 for grade-specific samples of the EOC mathematics tests for Algebra I and Geometry.

In general, moderate correlations between cluster scores should be expected since, by design, the clusters measure various aspects of the same construct. The findings given in Table 8.5 show that, in general, moderate intercorrelations were obtained. More specifically, in general they ranged between .39 and .67. As also would be expected, the correlations were higher among clusters that assessed more similar skills than they were among clusters that assessed somewhat dissimilar skills. For example, in mathematics, the clusters related to number sense correlated more highly with the cluster Algebra and Data Analysis than they did with Measurement and Geometry.

### Generalizability Analyses for Writing

Generalizability analyses were performed on students' writing scores for grades four and seven to assess the proportion of variance explained by raters, writing prompt, and persons.

The details on the design and methodology are described in the subsection “Generalizability Analyses” in the “Writing Score Reliability” section on page 184. Details about the results can be found in Table 8.B.74 and Table 8.B.75 on page 262.

A decision study (d-study) was conducted to look at the generalizability-coefficient (g-coefficient) for the writing scores; the g-coefficient was 0.76 for grade four and 0.74 for grade seven. The largest variance component was attributed to the “person” variation, which is the desired variation to occur among the examinee or “person” scores. Variation attributable to the construct-irrelevant rater variable was small, and the variation attributable to the prompt was negligible for both grades.

### **Evidence Based on Response Processes**

As noted in the APA, AERA, and NCME *Standards* (1999), additional support for a particular score interpretation or use can be provided by theoretical and empirical evidence indicating that examinees are using the intended response processes when responding to the items in a test. This evidence may be gathered from interacting with examinees in order to understand what processes underlie their item responses. Finally, evidence may also be derived from feedback provided by observers or judges involved in the scoring of examinee responses.

### **Evidence of Rater Reliability and Interrater Agreement**

Rater consistency for the writing prompt is critical to the CMA writing scores and their interpretations. These findings provide evidence of the degree to which raters agree in their observations about the qualities evident in students’ essay responses. In order to evaluate the reliability of the student scores on the writing prompts administered in grades four and seven, two raters scored approximately 10 percent of the examinee responses. The data collected were used to evaluate interrater reliability and interrater agreement.

#### **Interrater Reliability**

Cohen’s Kappa statistics findings provide evidence of the degree to which a student’s score may vary from rater to rater. Without explicit criteria to guide the rating process, two independent raters may not assign the same score to a given response. Research has shown the value of Kappa statistics between 0.41 and 0.60 as exhibiting moderate levels of agreement between the two ratings (Landis & Koch, 1977). The results in Table 8.B.70 and Table 8.B.71 showed moderate levels of agreement between raters that scored examinees’ written responses to the prompts administered in grades four and seven.

#### **Interrater Agreement**

As noted previously, approximately 10 percent of the test population’s responses to the writing prompts in grades four and seven were scored by two raters. The percentage of students for whom the raters were in exact agreement was 68 percent for grade four and 63 percent for grade seven. The percentage of essay responses for which there was exact or adjacent agreement between the two sets of ratings was 99.6 percent for grade four and 98.3 percent for grade seven.

### **Evidence Based on Internal Structure**

As suggested by the *Standards* (AERA, APA, & NCME, 1999), evidence of validity can also be obtained from studies of the properties of the item scores and the relationship between these scores and scores on components of the test. To the extent that the score properties and relationships found are consistent with the definition of the construct measured by the test, support is gained for interpreting these scores as measures of the construct.

For the CMA, it is assumed that a single construct underlies the total scores obtained on each test. Evidence to support this assumption can be gathered from the results of item analyses, evaluations of internal consistency, and studies of model-data fit, dimensionality, and reliability.

With respect to the subscores that are reported, these scores are intended to reflect examinees' knowledge and/or skill in an area that is part of the construct underlying the total test. Analyses of the intercorrelations among the subscores themselves and between the subscores and total test score can be used for studying this aspect of the construct. Information about the internal consistency of the items on which each subscore is based is also useful to provide.

### Classical Statistics

Point-biserial correlations calculated for the items in a test show the degree to which the items discriminate between students with low and high scores on a test. To the degree that the correlations are high, evidence that the items assess the same construct is provided. As shown in Table 8.1, the mean point biserial was between 0.31 and 0.39 for 13 out of 19 operational CMA and was between 0.25 and 0.30 for the other six CMA. The point biserials for the individual items in the CMA are presented in Table 8.A.1 through Table 8.A.5.

Also germane to the validity of a score interpretation are the ranges of item difficulty for the items on which a test score will be based. The finding that items have difficulties that span the range of examinee ability provides evidence that examinees at all levels of ability are adequately measured by the items. Information on average item  $p$ -values is given in Table 8.1; individual item  $p$ -values are presented in Table 8.A.1 through Table 8.A.5. (The distributions of IRT difficulty indicator  $b$ -values are given in Table 8.D.4 for new field-test items in the CMA for ELA in grades nine through eleven, EOC Algebra I and Geometry, and Life Science in grade ten. For operational items, the summaries of  $b$ -values can be found in Appendix D of the *CMA Technical Report* for the year the form was administered originally; see Table 8.4 on page 190 for administration years.)

The data in Table 8.1 indicate that CMA tests had average  $p$ -values that range from 0.46 to 0.62.

### Reliability

Reliability is a prerequisite for validity. The finding of reliability in student scores supports the validity of the inference that the scores reflect a stable construct. This section will describe briefly findings concerning the total test level, as well as reliability results for the reporting clusters.

**Overall reliability**—The reliability analyses on each of the operational CMA are presented in Table 8.2. The results indicate that the reliabilities of the CMA for ELA, mathematics, and science tests were moderately high, ranging from 0.71 to 0.88.

**Reporting cluster reliabilities**—For each CMA, number-correct scores are computed for the reporting clusters. The reliabilities of these scores are presented in Table 8.B.1 through Table 8.B.4 for the 19 CMA. The reliabilities of reporting clusters are invariably lower than those for the total tests because they are based on very few items. Consistent with the findings of previous years, the cluster reliabilities also are affected by the number of items in each cluster, with cluster scores based on fewer items having somewhat lower reliabilities than cluster scores based on more items.

Because the reliabilities of scores at the cluster level are lower, schools supplement the score results with other information when interpreting the results.

**Subgroup reliabilities**—The reliabilities of the 19 operational CMA and the two grade-specific CMA mathematics tests were also examined for various subgroups of the examinee population that differed in their demographic characteristics. The characteristics considered were gender, ethnicity, economic status, primary disabilities, English-language fluency, and ethnicity-by-economic status. The results of these analyses can be found in Table 8.B.5 through Table 8.B.20.

**Reliability of performance classifications**—The methodology used for estimating the reliability of classification decisions is described in the section “Decision Classification Analyses” on page 183. The results of these analyses are presented in Table 8.B.49 through Table 8.B.69 in Appendix 8.B; these tables start on page 254. When the classifications are collapsed to below proficient versus proficient and above, which are the critical categories for AYP analyses, the proportion of students that were classified accurately ranged from 0.87 to 0.95 across all the CMA. Similarly, the proportion of students that were classified consistently ranged from 0.87 to 0.93 for students classified into below proficient versus proficient and advanced.

These levels of accuracy and consistency are high and they are consistent with levels seen in previous years.

### Dimensionality

Dimensionality analyses were conducted by a CDE psychometrics team (Gaffney et al., 2010; Gaffney & Perryman, 2009). The study investigated the factor structures of the CMA in grades three and five as part of the peer review for ESEA.

Two factors corresponding to the ELA and mathematics domain were found for the CMA in these grades, as would be expected, since these tests were designed to measure different constructs.

### Evidence Based on Consequences of Testing

As observed in the *Standards*, tests are usually administered “with the expectation that some benefit will be realized from the intended use of the scores” (AERA, APA, & NCME, 1999, p. 18). When this is the case, evidence that the expected benefits accrue will provide support for the intended use of the scores. The CDE and ETS are in the process of determining what kinds of information can be gathered to assess the consequences of administration of the CMA.

## IRT Analyses

### Post-Equating

Prior to 2013, the CMA were equated to a reference form using a common-item nonequivalent groups design and post-equating methods based on IRT. The “base” or “reference” calibrations for the CMA were established by calibrating samples of data from a specific administration. Doing so established a scale to which subsequent item calibrations could be linked.

The procedures used for post-equating the CMA prior to 2013 involved three steps: item calibration, item parameter scaling, and production of raw-score-to-scale-score conversions using the scaled item parameters. ETS used GENASYS for the IRT item calibration and equating work. As part of this system, a proprietary version of the PARSCALE computer

program (Muraki & Bock, 1995) was used and parameterized to result in one-parameter calibrations. Research at ETS has suggested that PARSCALE calibrations done in this manner produce results that are virtually identical to results based on WINSTEPS (Way, Kubiak, Henderson, & Julian, 2002). The post-equating procedures were applied to all CMA tests.

### Pre-Equating

During the 2013 administration, because all the test forms were used in previous STAR operational administrations, pre-equating was conducted prior to administration of the tests. Based on the sample invariant property of item response theory (IRT), all the item parameter estimates were placed on the reference scale in their previous administrations through the post-equating procedure described above. For all CMA using reuse intact forms, the conversion tables from previous administrations when the forms were originally used are directly applied to the current administration.

The results of the IRT analyses for operational items are presented in Appendix 8.D of the *CMA Technical Report* produced for the year the form was originally administered. Reports are linked on the CDE's Technical Reports and Studies Web page at <http://www.cde.ca.gov/ta/tg/sr/technicalrpts.asp>.

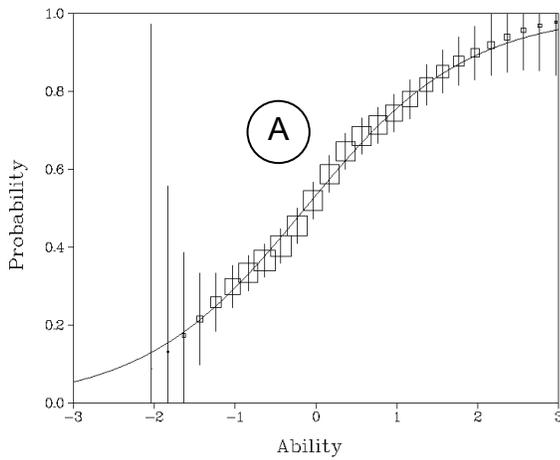

IRT analyses were performed on reused forms with field-test items that were administered for the first time in 2013. The CMA for ELA in grades nine through eleven, EOC mathematics Algebra I and Geometry, and Life Science in grade ten have IRT *b*-value and distribution tables available in Appendix 8.D starting on page 272.

### IRT Model-Data Fit Analyses

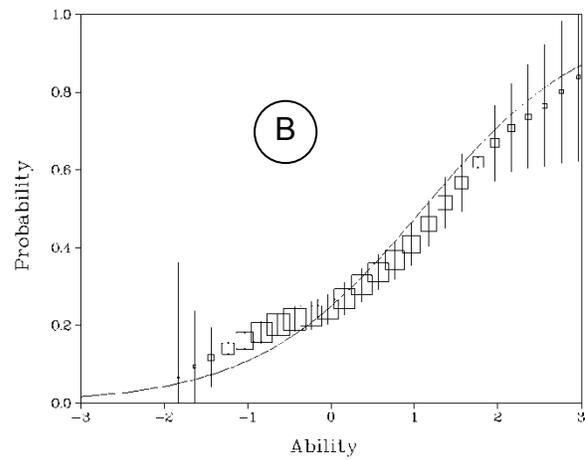

Because the Rasch model is used in equating the CMA, an important part of IRT analyses is the assessment of model-data fit. ETS psychometricians classify operational and field-test items for the CMA into discrete categories based on an evaluation of how well each item was fit by the Rasch model. The flagging procedure has categories of A, B, C, D, and F that are assigned based on an evaluation of graphical model-data fit information. Descriptors for each category are provided on page 197. In 2013, these analyses were performed for only those CMA with new field-test items—the CMA for ELA in grades nine through eleven, EOC mathematics Algebra I and Geometry, and Life Science in grade ten.

As an illustration, the IRT item characteristic curves and empirical data (item-ability regressions) for five CST items field-tested in 2005 are shown in Figure 8.3. These five items represent the various rating categories. The item number in the calibration and the ETS identification number for each item (“accession number”) are listed next to each item, along with the corresponding rating categories.

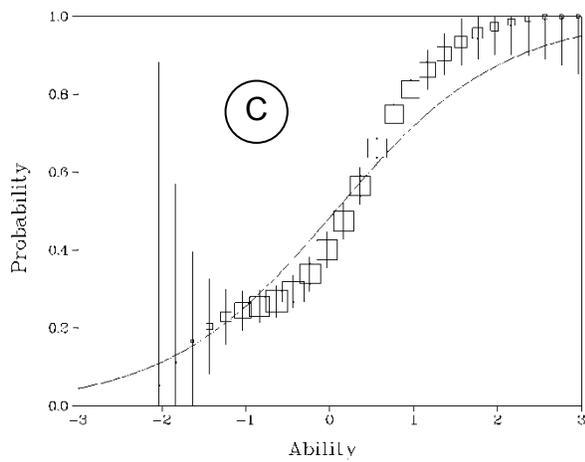

**Figure 8.3 Items from the 2005 CST for History–Social Science Grade Ten Field-test Calibration**

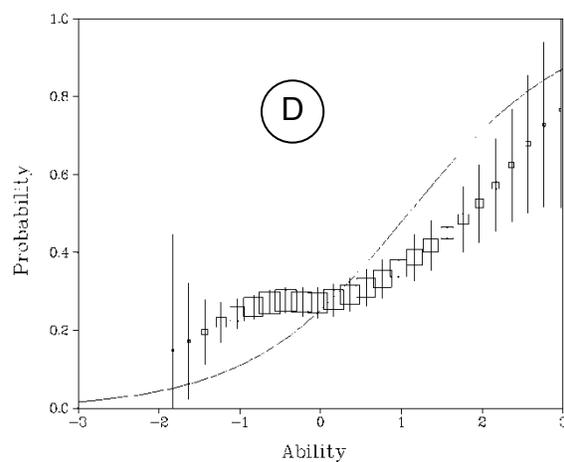

Version 30, Seq 29 (236) CSV23487 4-Choice  $P+ = 0.563$   
 $a = 0.588$  F,  $b = -0.135$ ,  $c = 0.000$  F, CHI = 5.41, N = 5,912

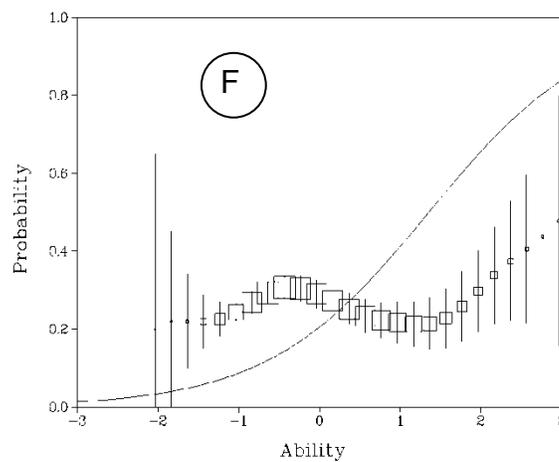

Version 1, Seq 28 (61) CSV22589 4 Choice  $P+ = 0.307$   
 $a = 0.588$  F,  $b = 1.104$ ,  $c = 0.000$  F, CHI = 66.70, N = 6,348

Version 18, Seq 30 (165) CSV20282 4-Choice  $P+ = 0.523$   
 $a = 0.588$  F,  $b = 0.066$ ,  $c = 0.000$  F, CHI = 208.99, N = 6,183

Version 9, Seq 32 (113) CSV20317 4-Choice  $P+ = 0.314$   
 $a = 0.588$  F,  $b = 1.089$ ,  $c = 0.000$  F, CHI = 361.31, N = 6,047

Version 21, Seq 31 (184) CSV20311 4-Choice  $P+ = 0.263$   
 $a = 0.588$  F,  $b = 1.356$ ,  $c = 0.000$  F, CHI = 1027.57, N = 6,277

**Flag A** (Item 236, CSV23487)

- Good fit of theoretical curve to empirical data along the entire ability range, may have some small divergence at the extremes
- Small Chi-square value relative to the other items in the calibration with similar sample sizes

**Flag B** (Item 061, CSV22589)

- Theoretical curve within error range across most of ability range, may have some small divergence at the extremes
- Acceptable Chi-square value relative to the other items in the calibration with similar sample sizes

**Flag C** (Item 165, CSV20282)

- Theoretical curve within error range at some regions and slightly outside of error range at remaining regions of ability range
- Moderate Chi-square value relative to the other items in the calibration with similar sample sizes
- This category often applies to items that appear to be functioning well but that are not well fit by the Rasch model

**Flag D** (Item 113, CSV20317)

- Theoretical curve outside of error range at some regions across ability range
- Large Chi-square value relative to the other items in the calibration with similar sample sizes

**Flag F** (Item 184, CSV20311)

- Theoretical curve outside of error range at most regions across ability range
- Probability of answering item correctly may be higher at lower ability than higher ability (U-shaped empirical curve)
- Very large Chi-square value relative to the other items with similar sample sizes and classical item statistics tend also to be very poor

In general, items with flagging categories of A, B, or C are all considered acceptable. Ratings of D are considered questionable, and the ratings of F indicate a poor model fit.

**Model-fit Assessment Results**

For the CMA that contained field-test items that were administered for the first time in 2013, the model-fit assessment is performed as part of the final item analyses using P2 data in the 2013 administration cycle; for all other CMA, the model-fit assessment was performed when the form was originally administered. The flags produced as a result of this assessment are placed in the item bank. The test developers are asked to avoid the items flagged as D, if possible, and to carefully review them if they must be used. Test developers are instructed to avoid using items rated F for operational test assembly without a review by a psychometrician and by CDE content specialists.

The number of the new field-test items in each IRT model-data fit classification is presented in Table 8.D.1 through Table 8.D.3 on page 272.

## Summaries of Scaled IRT *b*-values

For the post-equating procedure prior to the 2013 administration, once the IRT *b*-values were placed on the item bank scale, analyses were performed to assess the overall test difficulty, the difficulty level of reporting clusters, and the distribution of items in a particular range of item difficulty.

During the 2013 administration, IRT calibrations or scaling are only performed on the CMA that contain field-test items administered for the first time in 2013. However, scaled *b*-value parameters derived through the post-equating procedure from their previous administrations are used for pre-equating the CMA. Table 8.D.4 presents univariate statistics (mean, standard deviation, minimum, and maximum) for the scaled IRT *b*-values of the field-test items for CMA for ELA in grades nine through eleven, EOC Algebra I and Geometry, and Life Science in grade ten.

Table 8.D.5 through Table 8.D.7 show the distributions of field-test items across 16 intervals of *b*-values. In these tables the intervals range from “greater than or equal to 3.5” to “less than –3.5” points within each interval.

## Evaluation of Pre-equating

Pre-equating is performed on the basis of the assumption of item response theory (IRT) models that item parameters remain invariant across samples given a similar ability distribution. To produce results that are sufficiently accurate for high-stakes decisions, previously administered operational forms were reused so that item parameters were obtained from large, representative samples, and factors that may affect item parameter estimations, such as context effects (e.g., item positions) and speededness, were well controlled.

To ensure that items performed similarly in the current administration as in the year they were originally administered in the intact forms, comparisons of classical statistics such as *p*-values and point-biserial correlations are made between the current administration and the item bank values in the year of the original administration.

## Equating Results

During the 2013 administration, for all operational CMA using reuse forms without any edits, the conversion tables from their original administrations (listed in Table 8.4 on page 190) are directly applied to the current administration.

Complete raw-score-to-scale-score conversion tables for the CMA administered in 2013 are presented in Table 8.D.8 through Table 8.D.18 starting on page 275. The raw scores and corresponding transformed scale scores are listed in those tables. The scale scores were truncated at both ends of the scale so that the minimum reported scale score was 150 and the maximum reported scale score was 600. The scale scores defining the various performance-level cut points are presented in Table 2.1, which is in Chapter 2 on page 17.

## Differential Item Functioning Analyses

Analyses of DIF assess differences in the item performance of groups of students that differ in their demographic characteristics.

DIF analyses were performed on all field-test items administered for the first time in 2013—in the CMA for ELA in grades nine through eleven, EOC mathematics Algebra I and Geometry, and Life Science in grade ten—and for which sufficient student samples were available. The sample size requirements for the DIF analyses were 100 in the focal group

and 400 in the combined focal and reference groups. These sample sizes were based on standard operating procedures with respect to DIF analyses at ETS. The DIF analyses utilized the Mantel-Haenszel (MH) DIF statistic (Mantel & Haenszel, 1959; Holland & Thayer, 1985). This statistic is based on the estimate of constant odds ratio and is described as the following:

The  $\alpha_{MH}$  is the constant odds ratio taken from Dorans and Holland (1993, equation 7) and computed as:

$$\alpha_{MH} = \frac{\left( \sum_m R_{rm} \frac{W_{fm}}{N_{tm}} \right)}{\left( \sum_m R_{fm} \frac{W_{rm}}{N_{tm}} \right)} \quad (8.7)$$

$$MH\ D - DIF = -2.35 \ln[\alpha_{MH}] \quad (8.8)$$

where,

$R$  = number right,

$W$  = number wrong,

$N$  = total in:

$fm$  = focal group at ability  $m$ ,

$rm$  = reference group at ability  $m$ , and

$tm$  = total group at ability  $m$ .

Items analyzed for DIF at ETS are classified into one of three categories: A, B, or C. Category A contains items with negligible DIF. Category B contains items with slight to moderate DIF. Category C contains items with moderate to large values of DIF.

These categories have been used by ETS testing programs for more than 15 years. The definitions of the categories based on evaluations of the item-level MH D-DIF statistics are as follows:

DIF Category	Definition
A (negligible)	<ul style="list-style-type: none"> <li>• Absolute value of MH D-DIF is not significantly different from zero, or is less than one.</li> <li>• Positive values are classified as “A+” and negative values as “A-.”</li> </ul>
B (moderate)	<ul style="list-style-type: none"> <li>• Absolute value of MH D-DIF is significantly different from zero but not from one, and is at least one; OR</li> <li>• Absolute value of MH D-DIF is significantly different from one, but is less than 1.5.</li> <li>• Positive values are classified as “B+” and negative values as “B-.”</li> </ul>
C (large)	<ul style="list-style-type: none"> <li>• Absolute value of MH D-DIF is significantly different from one, and is at least 1.5.</li> <li>• Positive values are classified as “C+” and negative values as “C-.”</li> </ul>

The factors considered in the DIF analyses included gender, ethnicity, level of English-language fluency, and primary disability. The results of the DIF analyses for the field-test items administered for the first time in 2013 are presented in Appendix 8.E. Note, however,

that analyses of English learners on the CMA for ELA are presented for readers' interest. Differential performance on an ELA item that is due to the language difficulties of nonnative speakers does not indicate that an item is unfair or biased.

There are no significant DIF (C-DIF) for the new field test items administered for the first item in 2013. Were there, test developers would be instructed to avoid selecting field-test items flagged as having shown DIF that disadvantages a focal group (C-DIF) for future operational test forms unless their inclusion is deemed essential to meeting test-content specifications.

Table 8.E.1 through Table 8.E.6 show the distributions of field-test items across the DIF category classifications for the CMA. In these tables, classifications of B- or C- indicate DIF against a focal group; classifications of B+ and C+ indicate DIF in favor of a focal group. The last two columns of each table show the total number of items flagged for DIF in one or more comparisons. Table 8.6 lists specific subgroups that were used for DIF analyses for the CMA.

**Table 8.6 Subgroup Classification for DIF Analyses**

DIF Type	Reference Group		Focal Group
	Male	Female	
<b>Gender</b>			
<b>Race/Ethnicity</b>	White		African American
			American Indian
			Asian
			Combined Asian Group (Asian/Pacific Islander/Filipino)
			Filipino
			Hispanic/Latin American
			Pacific Islander
<b>Disability</b>	Specific Learning Disability		Autism
			Deaf-Blindness
			Deafness
			Emotional disturbance
			Hard of hearing
			Mental retardation/Intellectual disability (MR/ID)
			Multiple disabilities
			Orthopedic impairment
			Other health impairment
			Speech or language impairment
			Traumatic brain injury
	Visual impairment

## Appendix 8.B—Reliability Analyses

The reliabilities are reported only for samples that comprise 11 or more examinees. Also, in some cases in Appendix 8.B, score reliabilities were not estimable and are presented in the tables as hyphens. Finally, results based on samples that contain 50 or fewer examinees should be interpreted with caution due to small sample sizes.

## Appendix 8.C—Validity Analyses

Note that, while the correlations are reported only for samples that comprise 11 or more examinees, results based on samples that contain 50 or fewer examinees should be interpreted with caution due to small sample sizes. Correlations between scores on any two content-area tests where 10 or fewer examinees took the tests are expressed as hyphens. Correlations between scores on two content-area tests that cannot be administered together to the same group of students are expressed as “N/A.”

## Chapter 9: Quality Control Procedures

---

Rigorous quality control procedures were implemented throughout the test development, administration, scoring, and reporting processes. As part of this effort, ETS maintains an Office of Testing Integrity (OTI) that resides in the ETS legal department. The OTI provides quality assurance services for all testing programs administered by ETS. In addition, the Office of Professional Standards Compliance at ETS publishes and maintains the *ETS Standards for Quality and Fairness*, which supports the OTI's goals and activities. The purposes of the *ETS Standards for Quality and Fairness* are to help ETS design, develop, and deliver technically sound, fair, and useful products and services; and to help the public and auditors evaluate those products and services.

In addition, each department at ETS that is involved in the testing cycle designs and implements an independent set of procedures to ensure the quality of its products. In the next sections, these procedures are described.

### Quality Control of Item Development

The item development process for the CMA is described in detail in Chapter 3, starting on page 60. The next sections highlight elements of the process devoted specifically to the quality control of item development. During the 2013 CMA administration, there was no new item development except in the CMA for ELA in grades nine through eleven, EOC mathematics Algebra I and Geometry, and Life Science in grade ten.

#### Item Specifications

ETS maintains item specifications for each CMA and has developed an item utilization plan to guide the development of the items for each content area. Item writing emphasis is determined in consultation with the CDE. Adherence to the specifications ensures the maintenance of quality and consistency in the item development process.

#### Item Writers

The items for each CMA are written by item writers who have a thorough understanding of the California content standards. The item writers are carefully screened and selected by senior ETS content staff and approved by the CDE. Only those with strong content and teaching backgrounds are invited to participate in an extensive training program for item writers.

#### Internal Contractor Reviews

Once items have been written, ETS assessment specialists make sure that each item goes through an intensive internal review process. Every step of this process is designed to produce items that exceed industry standards for quality. It includes three rounds of content reviews, two rounds of editorial reviews, an internal fairness review, and a high-level review and approval by a content-area director. A carefully designed and monitored workflow and detailed checklists help to ensure that all items meet the specifications for the process.

#### Content Review

ETS assessment specialists make sure that the test items and related materials comply with ETS's written guidelines for clarity, style, accuracy, and appropriateness and with approved item specifications.

The artwork and graphics for the items are created during the internal content review period so assessment specialists can evaluate the correctness and appropriateness of the art early

in the item development process. ETS selects visuals that are relevant to the item content and that are easily understood so students do not struggle to determine the purpose or meaning of the questions.

### **Editorial Review**

Another step in the ETS internal review process involves a team of specially trained editors who check questions for clarity, correctness of language, grade-level appropriateness of language, adherence to style guidelines, and conformity to acceptable item-writing practices. The editorial review also includes rounds of copyediting and proofreading. ETS strives for error-free items beginning with the initial rounds of review.

### **Fairness Review**

One of the final steps in the ETS internal review process is to have all items and stimuli reviewed for fairness. Only ETS staff members who have participated in the ETS Fairness Training, a rigorous internal training course, conduct this bias and sensitivity review. These staff members have been trained to identify and eliminate test questions that contain content that could be construed as offensive to, or biased against, members of specific ethnic, racial, or gender groups.

### **Assessment Director Review**

As a final quality control step, the content area's assessment director or another senior-level content reviewer reads each item before it is presented to the CDE.

### **Assessment Review Panel Review**

The ARPs are panels that advise the CDE and ETS on areas related to item development for the CMA. The ARPs are responsible for reviewing all newly developed items for alignment to the California content standards. The ARPs also review the items for accuracy of content, clarity of phrasing, and quality. See page 64 in Chapter 3 for additional information on the function of ARPs within the item-review process.

### **Statewide Pupil Assessment Review Panel Review**

The SPAR panel is responsible for reviewing and approving the achievement tests that are to be used statewide for the testing of students in California public schools in grades two through eleven. The SPAR panel representatives ensure that the test items conform to the requirements of *EC* Section 60602. The constructed response writing tasks are also presented to the SPAR panel for review. If the SPAR panel rejects specific items and/or constructed response writing tasks, the items and/or tasks are replaced with other items and/or tasks. See page 67 in Chapter 3 for additional information on the function of the SPAR panel within the item-review process.

### **Data Review of Field-tested Items**

ETS field tests newly developed items to obtain statistical information about item performance. This information is used to evaluate items that are candidates for use in operational test forms. The items and item statistics are examined carefully at data review meetings, where content experts discuss items that have poor statistics and do not meet the psychometric criteria for item quality. The CDE defines the criteria for acceptable or unacceptable item statistics. These criteria ensure that the item (1) has an appropriate level of difficulty for the target population; (2) discriminates well between examinees that differ in ability; and (3) conforms well to the statistical model underlying the measurement of the intended constructs. The results of analyses for differential item functioning (DIF) are used to make judgments about the appropriateness of items for various subgroups; in the 2013 administration, DIF analyses are conducted for the CMA for ELA in grades nine through

eleven, EOC Algebra I and Geometry, and Life Science in grade ten only for the newly developed items.

The ETS content experts make recommendations about whether to accept or reject each item for inclusion in the California item bank. The CDE content experts review the recommendations and make the final decision on each item.

## Quality Control of the Item Bank

After the data review, items are placed in the item bank along with their statistics and reviewers' evaluations of their quality. ETS then delivers the items to the CDE through the California electronic item bank. The item bank database is maintained by a staff of application systems programmers, led by the Item Bank Manager, at ETS. All processes are logged; all change requests—including item bank updates for item availability status—are tracked; and all output and California item bank deliveries are quality-controlled for accuracy.

Quality of the item bank and secure transfer of the California item bank to the CDE are very important. The ETS internal item bank database resides on a server within the ETS firewall; access to the SQL Server database is strictly controlled by means of system administration. The electronic item banking application includes a login/password system to authorize access to the database or designated portions of the database. In addition, only users authorized to access the specific database are able to use the item bank. Users are authorized by a designated administrator at the CDE and at ETS.

ETS has extensive experience in accurate and secure data transfer of many types including CDs, secure remote hosting, secure Web access, and secure file transfer protocol (SFTP), which is the current method used to deliver the California electronic item bank to the CDE. In addition, all files posted on the SFTP site by the item bank staff are encrypted with a password.

The measures taken for ensuring the accuracy, confidentiality, and security of electronic files are as follows:

- Electronic forms of test content, documentation, and item banks are backed up electronically, with the backup media kept off site, to prevent loss from system breakdown or a natural disaster.
- The offsite backup files are kept in secure storage, with access limited to authorized personnel only.
- Advanced network security measures are used to prevent unauthorized electronic access to the item bank.

## Quality Control of Test Form Development

The ETS Assessment Development group is committed to providing the highest quality product to the students of California and has in place a number of quality control (QC) checks to ensure that outcome. During the item development process, there are multiple senior reviews of items and passages, including one by the assessment director. Test forms certification is a formal quality control process established as a final checkpoint prior to printing. In it, content, editorial, and senior development staff review test forms for accuracy and clueing issues.

ETS also includes quality checks throughout preparation of the form planners. A form planner specifications document is developed by the test development team lead with input

from ETS's item bank and statistics groups; this document is then reviewed by all team members who build forms at a training session specific to form planners before the form-building process starts. After trained content team members sign off on a form planner, a representative from the internal QC group reviews each file for accuracy against the specifications document. Assessment directors review and sign off on form planners prior to processing.

As processes are refined and enhanced, ETS will implement further QC checks as appropriate.

## **Quality Control of Test Materials**

### **Collecting Test Materials**

Once the tests are administered, school districts return scorable and nonscorable materials within five working days after the last selected testing day of each test administration period. For the writing administration, school districts return the CMA writing booklets within two working days after the makeup day for each administration. The freight return kits provided to the districts contain color-coded labels identifying scorable and nonscorable materials and labels with bar-coded information identifying the school and district. The school districts apply the appropriate labels and number the cartons prior to returning the materials to the processing center by means of their assigned carrier. The use of the color-coded labels streamlines the return process.

All scorable materials are delivered to the Pearson scanning and scoring facilities in Iowa City, Iowa. The nonscorable materials, including test booklets, are returned to the Security Processing Department in Pearson's Cedar Rapids, Iowa, facility. ETS and Pearson closely monitor the return of materials. The STAR Technical Assistance Center (TAC) at ETS monitors returns and notifies school districts that do not return their materials in a timely manner. STAR TAC contacts the district STAR coordinators and works with them to facilitate the return of the test materials.

### **Processing Test Materials**

Upon receipt of the test materials, Pearson uses precise inventory and test processing systems, in addition to quality assurance procedures, to maintain an up-to-date accounting of all the testing materials within its facilities. The materials are removed carefully from the shipping cartons and examined for a number of conditions, including physical damage, shipping errors, and omissions. A visual inspection to compare the number of students recorded on the School and Grade Identification (SGID) sheets with the number of answer documents in the stack is also conducted.

Pearson's image scanning process captures security information electronically and compares scorable material quantities reported on the SGIDs to actual documents scanned. School districts are contacted by phone if there are any missing shipments or the quantity of materials returned appears to be less than expected.

## **Quality Control of Scanning**

Before any STAR documents are scanned, Pearson conducts a complete check of the scanning system. ETS and Pearson create test decks for every test and form. Each test deck consists of approximately 25 answer documents marked to cover response ranges, demographic data, blanks, double marks, and other responses. Fictitious students are created to verify that each marking possibility is processed correctly by the scanning program. The output file generated as a result of this activity is thoroughly checked against

each answer document after each stage to verify that the scanner is capturing marks correctly. When the program output is confirmed to match the expected results, a scan program release form is signed and the scan program is placed in the production environment under configuration management.

The intensity levels of each scanner are constantly monitored for quality control purposes. Intensity diagnostics sheets are run before and during each batch to verify that the scanner is working properly. In the event that a scanner fails to properly pick up items on the diagnostic sheets, the scanner is recalibrated to work properly before being allowed to continue processing student documents.

Documents received in poor condition (torn, folded, or water-stained) that could not be fed through the high-speed scanners are either scanned using a flat-bed scanner or keyed into the system manually.

### **Post-scanning Edits**

After scanning, there are three opportunities for demographic data to be edited:

- After scanning, by Pearson online editors
- After Pearson online editing, by district STAR coordinators (demographic edit)
- After paper reporting, by district STAR coordinators

Demographic edits completed by the Pearson editors and by the district STAR coordinators online are included in the data used for the paper reporting and for the technical reports.

## **Quality Control of Image Editing**

Prior to submitting any STAR operational documents through the image editing process, Pearson creates a mock set of documents to test all of the errors listed in the edit specifications. The set of test documents is used to verify that each image of the document is saved so that an editor would be able to review the documents through an interactive interface. The edits are confirmed to show the appropriate error, the correct image to edit the item, and the appropriate problem and resolution text that instructs the editor on the actions that should be taken.

Once the set of mock test documents is created, the image edit system completes the following procedures:

1. Scan the set of test documents.
2. Verify that the images from the documents are saved correctly.
3. Verify that the appropriate problem and resolution text displays for each type of error.
4. Submit the post-edit program to assure that all errors have been corrected.

Pearson checks the post file against expected results to ensure the appropriate corrections are made. The post file will have all keyed corrections and any defaults from the edit specifications.

## **Quality Control of Answer Document Processing and Scoring**

### **Accountability of Answer Documents**

In addition to the quality control checks carried out in scanning and image editing, the following manual quality checks are conducted to verify that the answer documents are correctly attributed to the students, schools, districts, and subgroups:

- Grade counts are compared to the District Master File Sheets.
- Document counts are compared to the School Master File Sheets.
- Document counts are compared to the SGIDs.

Any discrepancies identified in the steps outlined above are followed up by Pearson staff with the school districts for resolution.

### **Processing of Answer Documents**

Prior to processing operational answer documents and executing subsequent data processing programs, ETS conducts an end-to-end test. As part of this test, ETS prepares approximately 700 test cases covering all tests and many scenarios designed to exercise particular business rule logic. ETS marks answer documents for those 700 test cases. They are then scanned, scored, and aggregated. The results at various inspection points are checked by psychometricians and Data Quality Services staff. Additionally, a post-scan test file of approximately 50,000 records across the STAR Program is scored and aggregated to test a broader range of scoring and aggregation scenarios. These procedures assure that students and school districts receive the correct scores when the actual scoring process is carried out. In 2013, end-to-end testing also included the inspection of results in quick-turnaround reporting.

### **Scoring and Reporting Specifications**

ETS develops standardized scoring procedures and specifications so testing materials are processed and scored accurately. These documents include:

- General Reporting Specifications
- Form Planner Specifications
- Aggregation Rules
- “What If” List
- Edit Specifications
- Reporting Cluster Names and Item Numbers
- CST and CMA Matching Criteria
- Matching Criteria for Multiple-choice and Writing Answer Documents

Each of these documents is explained in detail in Chapter 7, starting on page 115. The scoring specifications are reviewed and revised by the CDE, ETS, and Pearson each year. After a version that all parties endorse is finalized, the CDE issues a formal approval of the scoring and reporting specifications.

### **Matching Information on CMA Answer Documents**

Answer documents are designed to produce a single complete record for each student. This record includes demographic data and scanned responses for each student; once computed, the scored responses and the total test scores for a student are also merged into the same record. All scores must comply with the ETS scoring specifications.

All STAR answer documents contain uniquely numbered lithocodes that are both scannable and eye-readable. The lithocodes allow all pages of the document to be linked throughout processing, even after the documents have been slit into single sheets for scanning. For those students using more than one answer document, lithocodes link their demographics and responses within a document while matching criteria are used to create a single record

for all of the student's documents. The documents are matched within grade using the matching criteria approved by the CDE.

### **Matching Multiple-choice and Writing Scores for ELA in Grades Four and Seven**

The multiple-choice and writing sections of the ELA tests in grades four and seven are administered in separate settings. The answer documents from each section are subsequently matched using the matching criteria approved by the CDE, and scores from each section are reported on the same Student Report. However, the writing scores are not included in the calculation of CMA ELA scale scores in grades four and seven during 2013 administration.

Student results that cannot be matched based on the approved criteria are reported separately. In addition, school districts receive an unmatched report with their reporting package listing students in grades four and seven for whom there is either a multiple-choice score but no writing score or a writing score but no multiple-choice score.

### **Storing Answer Documents**

After the answer documents have been scanned, edited, and scored, and have cleared the clean-post process, they are palletized and placed in the secure storage facilities at Pearson. The materials are stored until October 31 of each year, after which ETS requests permission to destroy the materials. After receiving CDE approval, the materials are destroyed in a secure manner.

## **Quality Control of Psychometric Processes**

### **Score Key Verification Procedures**

ETS and Pearson take various necessary measures to ascertain that the scoring keys are applied to the student responses as expected and the student scores are computed accurately. Scoring keys, provided in the form planners, are produced by ETS and verified thoroughly by performing multiple quality control checks. The form planners contain the information about an assembled test form; other information in the form planner includes the test name, administration year, subscore identification, and standards and statistics associated with each item. The quality control checks that are performed before keys are finalized are listed on page 117 in Chapter 7.

### **Quality Control of Item Analyses and the Equating Process**

When the forms were first administered, the psychometric analyses conducted at ETS underwent comprehensive quality checks by a team of psychometricians and data analysts. Detailed checklists were consulted by members of the team for each of the statistical procedures performed on each CMA following its original administration. Quality assurance checks also included a comparison of the current year's statistics to statistics from previous years. The results of preliminary classical item analyses that provided a check on scoring keys are also reviewed by a senior psychometrician. The items that were flagged for questionable statistical attributes were sent to test development staff for their review; their comments were reviewed by the psychometricians before items are approved to be included in the equating process.

The results of the equating process are reviewed by a psychometric manager in addition to the aforementioned team of psychometricians and data analysts. If the senior psychometrician and the manager reach a consensus that an equating result does not conform to the norm, special binders are prepared for review by senior psychometric advisors at ETS, along with several pieces of informative analyses to facilitate the process.

When the forms were equated following their original administration, a few additional checks were performed for the calibration, scaling, and scoring table creation processes, as described below:

### **Calibrations**

During the calibration that was conducted for the original administration of each form and is described in detail in Chapter 2 starting on page 15, checks were made to ascertain that the correct options for the analyses were selected. Checks were also made on the number of items, number of examinees with valid scores, IRT Rasch item difficulty estimates, standard errors for the Rasch item difficulty estimates, and the match of selected statistics to the results on the same statistics obtained during preliminary item analyses. Psychometricians also performed detailed reviews of plots and statistics to investigate if the model fit the data.

### **Scaling**

During the scaling that was conducted for the original administration of each form, checks were made to ensure the following:

- The correct items were used for linking;
- The scaling evaluation process, including stability analysis and subsequent removal of items from the linking set (if any), was implemented according to specification (see details in the “Evaluation of Scaling” section in Chapter 8 of the original year’s technical report); and
- The resulting scaling constants were correctly applied to transform the new item difficulty estimates onto the item bank scale.

### **Scoring Tables**

Once the equating activities were complete and raw-score-to-scale-score conversion tables were generated after the original administration of each content-area test, the psychometricians carried out quality control checks on each scoring table. Scoring tables were checked to verify the following:

- All raw scores are included in the tables;
- Scale scores increase as raw scores increase;
- The minimum reported scale score is 150 and maximum reported scale score is 600; and
- The cut points for the performance levels are correctly identified.

As a check on the reasonableness of the performance levels, when the tests were originally administered, psychometricians compared results from the current year with results from the past year at the cut points and the percentage of students in each performance level within the equating samples. After all quality control steps were completed and any differences were resolved, a senior psychometrician inspected the scoring tables as the final step in quality control before ETS delivered them to Pearson.

During the current administration, the data derived from prior item analyses are used to pre-equate the 2013 results. Key checks and classical item analyses are also conducted on the current data. For tests with no item replacements, the scoring tables are reused and they are checked against the scoring tables in the re-use year technical report to ensure exact match. For tests with item replacements, the new scoring tables are checked against scoring tables in the re-use year conversion for reasonableness. In addition, prior to reporting in 2013, every regular and special-version multiple-choice test was “certified” by

ETS prior to being included in quick-turnaround reporting. To certify a test, psychometricians gathered a certain number of test cases and verified the accurate application of scoring keys and conversion tables.

### **Score Verification Process**

Pearson utilizes the raw-to-scale scoring tables to assign scale scores for each student. ETS verifies Pearson's scale scores by independently generating the scale scores for students in a small number of school districts and comparing these scores with those generated by Pearson. The selection of districts is based on the availability of data for all schools included in those districts, known as "pilot districts."

### **Year-to-Year Comparison Analyses**

Year-to-year comparison analyses are conducted each year for quality control of the scoring procedure in general and as reasonableness checks for the CMA results.

- The first set of year-to-year comparison analyses looks at the tendencies and trends for the schools and school districts for which ETS has received complete or near-complete results by mid-June.
- The second set of year-to-year comparison analyses uses over 90 percent of the entire testing populations to look at the tendencies and trends for the state as a whole as well as a few large districts.

The results of the year-to-year comparison analyses are provided to the CDE, and their reasonableness is jointly discussed. Any anomalies in the results are investigated further, and scores are released only after explanations that satisfy both CDE and ETS are obtained.

### **Offloads to Test Development**

During the original administration of the CMA forms that are reused in 2013, the statistics based on classical item analyses and the IRT analyses were obtained at two different times in the testing cycle. The first time, the statistics were obtained on the equating samples to ensure the quality of equating and then on larger sample sizes to ensure the stability of the statistics that were to be used for future test assembly. Statistics used to generate DIF flags are also obtained from the larger samples. The resulting classical, IRT, and DIF statistics for all items are provided to test development staff in specially designed Excel spreadsheets called "statistical offloads." The offloads are thoroughly checked by the psychometric staff before their release for test development review.

During the 2013 administration, statistical offloads for ELA in grades nine through eleven, EOC Algebra I and Geometry, and Life Science in grade ten include classical, IRT, and DIF statistics obtained from the large sample for all items. However, only classical item statistics obtained on larger samples for all operational items are included in the statistical offloads for grades three through eight grade-level tests.

### **Quality Control of Reporting**

For the quality control of various STAR student and summary reports, four general areas are evaluated, including the following:

1. Comparing report formats to input sources from the CDE-approved samples
2. Validating and verifying the report data by querying the appropriate student data

3. Evaluating the production print execution performance by comparing the number of report copies, sequence of report order, and offset characteristics to the CDE's requirements
4. Proofreading reports by the CDE, ETS, and Pearson prior to any school district mailings

All reports are required to include a single, accurate CDS code, a charter school number (if applicable), a school district name, and a school name. All elements conform to the CDE's official CDS code and naming records. From the start of processing through scoring and reporting, the CDS Master File is used to verify and confirm accurate codes and names. The CDS Master File is provided by the CDE to ETS throughout the year as updates are available.

For students who use more than one answer document, the matching process, as described on page 295, provides for the creation of individual student records from which reports are created.

After the reports are validated against the CDE's requirements, a set of reports for pilot districts is provided to the CDE and ETS for review and approval. Pearson sends paper reports on the actual report forms, foldered as they are expected to look in production. The CDE and ETS review and sign off on the report package after a thorough review.

Upon the CDE's approval of the reports generated from the pilot districts, Pearson proceeds with the first production batch test. The first production batch is selected to validate a subset of school districts that contains examples of key reporting characteristics representative of the state as a whole. The first production batch test incorporates CDE-selected school districts and provides the last check prior to generating all reports and mailing them to the districts.

### **Quick-turnaround Reporting**

To reduce the time between testing and acquisition of results, students' scale scores and performance levels for CMA multiple-choice tests were made available to districts within approximately two weeks of processing the school district's scorable testing materials. A new Web application, called the Quick-turnaround Reporting module, was added to the STAR Management System; this module permits districts to securely download a file containing these results.

Before a district can download a student data file, ETS statisticians must approve a QC file of test results data and ETS IT must successfully process the QC file. Once the data are deemed reliable and Pearson has processed a scorable test booklet or answer document for every student who took a CMA in that test administration for the school district, the district is notified that these results are available.

### **Excluding Student Scores from Summary Reports**

ETS provides specifications to the CDE that document when to exclude student scores from summary reports. These specifications include the logic for handling answer documents that, for example, indicate the student tested but marked no answers, was absent, was not tested due to parent/guardian request, or did not complete the test due to illness. The methods for handling other anomalies (for example, for a grade eight mathematics test where the specific mathematics test is unknown) are also covered in the specifications.

# Chapter 10: Historical Comparisons

## Base Year Comparisons

Historical comparisons of the CMA results are routinely performed to identify the trends in examinee performance and test characteristics over time. Such comparisons were performed for ELA in grades three through eight, mathematics in grades three through seven, and science in grades five and eight over the three most recent administrations—2011, 2012, and 2013—and the base year; for ELA in grade nine, Algebra I, and grade ten Life Science for the two most recent administrations of 2012 and 2013 and the base year; and for ELA in grades ten and eleven and EOC Geometry for 2013 and the base year.

The indicators of examinee performance include the mean and standard deviation of scale scores, observed score ranges, and the percentage of examinees classified into proficient and advanced performance levels. Test characteristics are compared by looking at the mean proportion correct, overall reliability and SEM, as well as the mean IRT *b*-value for each CMA.

The base year of each CMA refers to the year in which the base score scale was established. Operational forms administered in the years following the base year are linked to the base year score scale using procedures described in Chapter 2.

The base years for the CMA are presented in Table 10.1.

**Table 10.1 Base Years for the CMA**

Content Area	CMA	Base Year	
English–Language Arts	3	2009	
	4	2009	
	5	2009	
	6	2010	
	7	2010	
	8	2010	
	9	2011	
	10	2012	
	11	2012	
	Mathematics	3	2009
		4	2009
5		2009	
6		2010	
7		2010	
Algebra I		2011	
Science	Geometry	2012	
	5	2009	
	8	2010	
	10 Life Science	2011	

The base years differ over CMA grades and content areas. Reasons for these differences are as follows:

- In spring 2008, the CMA were first administered statewide for ELA and mathematics in grades three through five and for science in grade five. A standard setting was held in fall 2008 to establish cut scores for the below basic, basic, proficient, and advanced performance levels (the cut score for the far below basic performance level was set statistically). Spring 2009 was the first administration in which test results were reported

using the new scales and cut scores for the five performance levels; thus, 2009 became the base year for these tests.

- In spring 2009, the CMA were first administered statewide for ELA in grades six through eight, mathematics in grades six and seven, and science in grade eight. A standard setting was held in fall 2009 to establish cut scores for the below basic, basic, proficient, and advanced performance levels (the cut score for the far below basic performance level was set statistically). Spring 2010 was the first administration in which test results were reported using the new scales and cut scores for the five performance levels; thus, 2010 became the base year for these tests.
- In spring 2010, the CMA were first administered statewide for ELA in grade nine, Algebra I, and grade ten Life Science. A standard setting was held in fall 2010 to establish cut scores for the below basic, basic, proficient, and advanced performance levels (the cut score for the far below basic performance level was set statistically). Spring 2011 was the first administration in which test results were reported using the new scales and cut scores for the five performance levels; thus, 2011 became the base year for these tests.
- In spring 2011, the CMA were first administered statewide for ELA in grades ten and eleven and Geometry. A standard setting was held in fall 2011 to establish cut scores for the below basic, basic, proficient, and advanced performance levels (the cut score for the far below basic performance level was set statistically). Spring 2012 was the first administration in which test results were reported using the new scales and cut scores for the five performance levels; thus, 2012 became the base year for these tests.

## Examinee Performance

Table 10.A.1 on page 303 contains the number of examinees assessed and the means and standard deviations of examinees' scale scores in the base year and the past one, two, or three years, depending on the test. As noted in previous chapters, the CMA reporting scales range from 150 to 600 for all content areas.

CMA scale scores are used to classify student results into one of five performance levels: far below basic, below basic, basic, proficient, and advanced. The percentages of students qualifying for the proficient and advanced levels are presented in Table 10.A.2 on page 303; please note that this information may differ slightly from information found on the CDE's STAR reporting Web page at <http://star.cde.ca.gov> due to differing dates on which data were accessed. The goal is for all students to achieve at or above the proficient level by 2014. This goal for all students is consistent with school growth targets for state accountability and the federal requirements under the Elementary and Secondary Education Act.

Table 10.A.3 through Table 10.A.7 show for each CMA the distribution of scale scores observed in the base year, which differs according to test, and subsequent administrations in 2011, 2012, and 2013 as applicable. Frequency counts are provided for each scale score interval of 30. A frequency count of "N/A" indicates that there are no obtainable scale scores within that scale-score range. For all tests of the CMA, a minimum score of 300 is required for a student to reach the basic level of performance, and a minimum score of 350 is required for a student to reach the proficient level of performance.

## Test Characteristics

The item and test analysis results of the CMA over the comparison years indicate that the CMA meet the technical criteria established in professional standards for high-stakes tests. In addition, every year, efforts are made to improve the technical quality of each CMA. For example, in recent years, efforts have been made to field test more easy items for some CMA where previous field testing resulted in an overabundance of very difficult items.

Table 10.B.1 in Appendix 10.B, which starts on page 308, presents the average proportion correct values for the operational items in each CMA based on the equating samples. The mean proportion correct is affected by both the difficulty of the items and the abilities of the students administered the items. Table 10.B.2 shows the mean equated IRT  $b$ -values for the CMA operational items based on the equating samples. The mean equated IRT  $b$ -values reflect only average item difficulty. Please note that comparisons of mean  $b$ -values should be made only within a given test; they should not be compared across grade levels or content areas.

The average point-biserial correlations for all CMA operational tests are presented in Table 10.B.3. The reliabilities and standard error of measurement (SEM) expressed in raw score units appear in Table 10.B.4. Like the average proportion correct, point-biserial correlations and reliabilities of the operational items are affected by both item characteristics and student characteristics.

## Appendix 10.A—Historical Comparisons Tables, Examinee Performance
